L00/60
Bridge, M C 2000 *Tree-ring analysis of timbers from Brockley Hill farmhouse, Stanmore, Middlesex* Ancient Monuments Lab Rep, 4/2000

This building-at-risk is thought on typological grounds to be of 16th-century origin. It consists of a storied hall range and cross-wing, both with clasped-purlin roofs. It was hoped that the dendrochronological investigation would be able to distinguish whether or not the two main elements of the building were contemporaneous. The number of rings in the timbers could rarely be determined before sampling as they were often either painted or largely obscured within walls. Most timbers were found to be from very fast-grown oaks, felled before they were fifty years old. Two longer ring-width sequences were very sensitive and could not be dated.

L00/61
Bridge, M C 2000 *Tree-ring analysis of timbers from 'The Priory', Church Lane, Tottenham, London Borough of Haringey* Ancient Monuments Lab Rep, 24/2000

This house presents a Georgian facade to the outside world, but is built around an earlier core. Records suggest that it was built for a barber-surgeon, Joseph Fenton *c.* AD 1620. There are remnants of the original roof and floor in one part of the house. It had been suggested that the layout of the house could suggest an even earlier origin and dendrochronological study was

employed to date the few remaining timbers. One timber was felled in summer AD 1622, and a second had twenty sapwood rings with the outermost ring being formed in AD 1613, suggesting that they were contemporaneous. A third timber was dated but had no sapwood, only allowing a date after which it must have been felled (AD 1594). It appears therefore that the earliest surviving parts of this structure were indeed built in the early AD 1620s.

L00/62
Carr, R J M 2000 'London ship repair yards the Royal Albert Dock works' *London Ind Archaeol* 7, 55-64

A brief introduction to the London ship repair industry, followed by a selection of photographs of large machine tools still in use up to the late 1970s at the Royal Albert Dock works of River Thames Ship repairs Ltd. Similar large plant was used in boiler making and for the construction of steel bridges. Most equipment at London ship repair yards was made prior to WWII and some dated from *c.* 1900 or before.

L00/63
Divers, D 2000 'Excavation of post-medieval wharfside buildings, Dunbar Wharf, Narrow Street, Limehouse [Greater London], 1996' *Ind Archaeol Rev* 22 (1), 53-62

Describes the remains of a sequence of buildings dating from the 16th century that are presumed to have been used as warehouses until their demolition in the late 19th and 20th centuries.

L00/64
Douglas, A 2000 'Excavations at Rainbow Quay, an 18th-century whale rendering plant, Rotherhithe, London' *Post-Medieval Archaeol* 33 [1999], 179-93

Describes the results of excavations undertaken during July and August 1996, which investigated a sequence of dock-related structures dating from *c.* 1700, when the Howland Great Wet Dock (later the Greenland Dock) was constructed, through to the 1970s when the docks were closed. Discussion concentrates in particular on the 18th and 19th centuries, especially the structures pertaining to the whaling industry and the warehousing that replaced them.

L00/65
Dungworth, D 2000 *Analysis of non-ferrous Tudor and Stuart artefacts from Southwark, London* Ancient Monuments Lab Rep, 39/2000

Excavations from 1986 to 1992 of medieval and post-medieval royal and great houses in Southwark, London recovered large quantities of Tudor and Stuart artefacts. A selection of the non-ferrous artefacts was analysed to determine the range and proportion of alloys in use. Amongst the pewters there appeared to be a slight preference for tin-rich rather than lead-rich alloys. Amongst the copper alloys brass was by far the most common alloy type in use at this time.

L00/66

L00/68
Guillery, P 2000 'Greenwich Generating Station' *London Ind Archaeol* 7, 3-12

Constructed in 1902-10 for London County Council it is still in use as a back-up electricity source for London Underground. Notable as an early example of a steel-framed British building with stone-dressed stock-brick skin it is seen as having architectural distinction. Among a number of ancillary structures the most notable is the disused coaling pier in the River Thames which stands on sixteen huge cast-iron Doric columns.

L00/69

L00/76
Tyler, K 2000 'The production of tin-glazed ware on the north bank of the Thames: excavations at the site of the Hermitage Pothouse, Wapping' *Post-Medieval Archaeol* 33 [1999], 127-63

An account of excavations undertaken during 1996 at the Hermitage Basin, in the London Borough of Tower Hamlets, site of a documented tin-glaze (delft) ware manufactory. Two successive bottle kilns were revealed -- this type of kiln is normally associated with stoneware or earthenware production, although no other evidence for the manufacture of anything other than tin-glaze wares was found. These kilns predated a rectangular kiln that was in use after 1720 and which may have produced tin-glazed wall tiles and stoneware. The finds demonstrate that Wapping needs to be included with Southwark and Lambeth as a centre of manufacture in the period 1665-1773. Specialists' contributions comprise: 'The pottery' [and kiln furniture] by Roy Stephenson (146-53); 'Tin-glazed wall tiles' by Terrance Smith (153-5); 'The accessioned finds' by Richenda Goffin (155-7); and 'The clay tobacco pipes' by Kieron Heard (157-8).
