Project Officers

Andy Lines (2004-2006); Dan Ratcliffe (2004-2008) and Jennifer Marchant (2007-2008)

Project Manager: Dinah Saich (SYAS)

English Heritage Steering and Monitoring Group: Keith Miller, Inspector of Scheduled Monuments, Yorkshire and Humber Region; Graham Fairclough, Head of Characterisation; Roger M Thomas, Head of Urban Archaeology

Website Consultants: Jonathan Porter and Mike Shaw (Countryside); Chris Thomas (ROAM / Rotherham RBT)

Many individuals working on similar projects in other counties have influenced the development and progress of this project. Particular mention should go to our colleagues in other county and city archaeological services including Sarah Jane Farr (Merseyside); Debbie Langley, Mike Shaw and Paul Quigley (Black Country); Steve Toase (North Yorkshire County Council); David Walsh (Lincoln City Council); Duncan Coe (West Berkshire County Council); Leslie Mitchell and Karl Lunn (Greater Manchester).

Steve Dobson (University of Sheffield) and Elli Winterburn (Newcastle University) both provided useful feedback as part of their post-graduate studies into characterisation.

Data and advice has also been provided by Pete Herring, John Schofield and Roger RJ Thomas (English Heritage); Barnsley Archives; Barnsley MBC Renaissance-Design-Conservation; Camlin Lonsdale Landscape Architects; CPRE Peak District and South Yorkshire; Doncaster Archives; Doncaster MBC Environmental Planning; Doncaster MBC Conservation; Friends of the Porter Valley; Rotherham Archives and Local Studies; Rotherham MBC Conservation; SCC Urban Design & Conservation; SCC DEL Information Unit; SCC DEL Scanning Team; SCC Environmental Planning; SCC GIS team; SCC Parks and Countryside; Sheffield Archives; and Sheffield Local Studies Library.

Individuals who have freely given their time to advise us and discuss their own research or provided otherwise unpublished material include S. Adams, Christine Ball, Derek Bayliss, Bill Bevan, David Crossley, Barbara English, Neville Flavell, Graham Hague, Ken Hawley, Colin Merrony, Jim Rylatt, Archie Sinclair and Joan Unwin.

We would also like to acknowledge the generosity and skills of the contributors to the wonderful 'Geograph British Isles' website www.geograph.org.uk, which was the source of many of the photographs used in the report, licensed by creative commons licenses -

<http://creativecommons.org/licenses/by-sa/2.0/>. These photos remain the copyright of the original contributors and if reused must carry the present attribution and licence terms. Without these images we may never have finished this project!

All other project images are © All Rights Reserved. Please contact the original copyright holders indicated if you would like to reproduce any images not expressly licensed for reuse.

The project officers would especially like to thank the permanent members of the SYAS team during the life of the project: Louisa Matthews, Jim McNeil, Dinah Saich, Roy Sykes and, latterly, Andy Lines, were an almost endless source of information, inspiration, ideas, good humour and cups of tea over the life of the project.

Part I: Introduction

Summary

South Yorkshire has a rich history of settlement, farming, industry, recreation and commerce. These activities have all influenced the way the landscape has developed and the physical evidence of these human actions can be seen across the county. The South Yorkshire Historic Environment Characterisation project was undertaken between 2004 and 2008 to map this evidence, to try to understand the historic processes that had formed it and to develop strategies for the future protection and enhancement of the historic environment identified. This project was undertaken by the South Yorkshire Archaeology Service with funding from English Heritage.

As part of the project, a vast amount of data was collected to produce a complete picture of the current landscape of South Yorkshire and an understanding of how these landscapes and townscapes have changed through time. This data was then used to identify trends of historic development across the county. The resulting analysis can be found within this document and also makes up a significant part of the output made easily available to the public through an interactive website (www.sytimescapes.org.uk). This public output was developed alongside a digital resource made available to the four local authorities within South Yorkshire: Barnsley, Doncaster, Rotherham and Sheffield. This should assist with forward planning exercises, the production of Design Guides and numerous other activities that could impact upon the historic environment.

Background to Characterisation

English Heritage has been funding a nationwide programme of Historic Landscape Characterisation (HLC) since 1992. These studies have been run alongside a programme of Extensive Urban Surveys (EUS) looking at urban locations.

Characterisation aims to record the modern landscape and show how aspects of the past still exist around us. One of the guiding principles of this process is the need to work on all parts of the landscape not just those areas considered to be 'special'. This is a move away from understanding and protecting specific sites or buildings, to considering the wider historic environment.

Our surroundings are dynamically changing; these changes are part of a long history of human influence on the landscape. In order to manage these changes it is important to have a good understanding of the evolution of the landscape that surrounds us. Characterisation is not about trying to prevent change but about ensuring that decisions are made on an informed basis, ensuring that areas retain their local distinctiveness. It can be used alongside other systems of heritage management, such as Listing and Scheduling of sites and buildings. It gives a background to such sites and buildings, drawing them into a wider landscape perspective.

In 2001 the government acknowledged the value of characterisation for the management of change in the historic environment in its policy statement, *The Historic Environment: a Force for our Future* (DCMS/DTLR 2001).

In South Yorkshire the decision was made to combine HLC and EUS into one unified project known as Historic *Environment* Characterisation (HEC). This combined approach removes the artificial divide between rural and urban landscapes. An advantage of this approach is that it allows rural industrial and agricultural activities to be assessed alongside the development of the towns where the industrial work force lived.

The South Yorkshire Historic Environment Characterisation project aims to be a key resource that is accessible to a wide variety of different users. GIS technologies and databases make the project highly flexible and also make it possible for the project to be further developed after the end of this phase of work in 2008.

Topography and Geology of Project Area

South Yorkshire (Figure 1) covers four administrative districts (Barnsley MBC, Doncaster MBC, Rotherham MBC and Sheffield CC) and covers approximately 160,000 hectares (roughly 70km east-west by 45 km north-south). The majority of the area was part of the former West Riding of Yorkshire, but includes small areas formerly in Derbyshire and Nottinghamshire. The western fringe of South Yorkshire lies within the Peak District National Park, which has recently completed its own Historic Landscape Characterisation project (Barnatt, 2003).

Largely rural until the industrial revolution, much of South Yorkshire has in fact remained as such, with several of South Yorkshire's towns continuing as small market towns, e.g. Penistone, Tickhill and Bradfield. However, others, notably Barnsley, Doncaster, Rotherham and Sheffield, expanded considerably - giving the predominantly urban character of South Yorkshire today.

The topography of South Yorkshire is diverse, ranging from the highlands of the edge of the Peak District National Park, to the low peat-lands of the edge of Lincolnshire/Humberside. The Countryside Commission's Countryside Character volume 3 'Yorkshire and the Humber' (1998) describes five main Character Areas within the study area: the Dark Peak, the Yorkshire Southern Pennine Fringe, the Notts/Derby/Yorks Coalfield, the Southern Magnesian Limestone and the Humberhead Levels.

The report's treatment of these areas can be summarised as follows, from west to east:

Dark Peak - This character area has a '*wild and remote semi-natural character created by blanket bog, dwarf shrub heath and heather moorland with rough grazing and a lack of habitation*'. The area has a '*dramatic character created by sharply defined, elevated and vast plateaux with 'gritstone ridges' and edges and long uninterrupted views*'.

Yorkshire Southern Pennine Fringe - This area lies on the eastern slopes of the Pennines, where character has been determined by '*extensive urban influences from a matrix of large and small towns*', including the development of industry and associated settlement along river valleys. Vernacular building is in the local gritstone.

Nottinghamshire, Derbyshire and Yorkshire Coalfield - The characterisation describes a '*complex mix of built-up areas, industrial land, dereliction and farmed open country*' within '*rolling landforms with hills, escarpments and broad valleys*' - heavily influenced by the underlying Coal Measures. The characterisation notes evidence for wealth in earlier times, resulting in the endowment of '*large country houses, parks and estates*' and '*grandiose ...19th century Town and Civic Halls, Schools, Museums and Art Galleries*'. This is juxtaposed with the presently '*fragmented and downgraded landscape... a*

landscape of neglect' - the result of the decline of traditional heavy industries.

Southern Magnesian Limestone - This character area reflects the 'narrow [elevated] ridge... [that] acts as a distinct barrier between the industrial coalfields to the west, and the lowland vales to the east'. Fertile soil combined with the presence of 'a large number of country houses and estates' has created a 'generally large scale, open landscape...' where 'woodlands [combine] with open arable land to create a wooded farmland landscape'. The area contains the 'main transport corridor of the A1'. Vernacular building uses 'creamy white Magnesian Limestone... often combined with red clay pantile roofing'.

Humberhead Levels - This character area is similar to the low-lying Somerset Levels and the Fens. 'Field trees and hedgerows are generally few and far between and views are often long and unbroken to distant horizons, with the sky playing an important part'. Drainage has affected the character of this area, but 'around Fishlake and Sykehouse... the traditional pattern of small, thickly hedged fields, hedgerow trees, green lanes, networks of dikes and ditches... still remains'. The area includes the 'remnant raised mire' of Thorne and Hatfield Moors. Industrial and transport influences are seen as playing their part, with influences from the Selby coalfield and accompanying power stations, as well as from railways, major motorways and the canal.

Figure 1: South Yorkshire location map

Part II: Methodology

Overview

South Yorkshire is an area of diverse landscape character including open moorlands, agricultural countryside, medieval villages, market towns, and the expanding metropolitan centres of Barnsley, Doncaster, Rotherham and Sheffield. The methodology developed for this project allowed the varied scales of these activities to be recorded and set within the context of the surrounding landscape. This methodology was initially based upon the accepted best practice defined by the 2001-2 national HLC Method Review (Aldred & Fairclough 2003) and also through consideration of existing HLC and EUS projects. The methodology was later refined as part of the pilot phase on the project in 2004.

The characterisation and mapping phase of the project used MapInfo Professional v7.5 to create a GIS layer of the historic environment of South Yorkshire. The GIS was supported by a database using the Historic Landscape Character module of HBSMR v3.03 from exeGesIS Spatial Data Management.

This produced a generalised picture of the landscape, taking a 'broad brush' approach. Areas of land with common characteristics were identified and recorded as polygons within the GIS, with associated information on the current and past character of the landscape recorded within the database.

Sources of information

The project was primarily desk-based, utilising current mapping, historical mapping and vertical aerial photos. Modern digital mapping from the Ordnance Survey was provided by Sheffield City Council. Digital historic mapping from the Landmark Information Group joint historic mapping project was supplied under licence by English Heritage and rectified aerial photography was provided by the four South Yorkshire authorities. These sources were found to be far easier to use than traditional paper mapping as they made it possible to overlay maps of different ages upon one another and upon the aerial photographs.

The key digital historic maps utilised were Ordnance Survey Epochs 1-4 at 1:2500 and 1:10560 scales. Each map tile had different surveying and publication dates; the general date of each map is listed below (more specific dates can be found in the Map Bibliography at the end of this report).

OS 1:10560; Epoch 1 - c.1850
Epoch 2 - c.1890
Epoch 3 - c.1915
Epoch 4 - c.1940

OS 1:2500; Epoch 1 - c.1880
 Epoch 2 - c.1900
 Epoch 3 - c.1920
 Epoch 4 - c.1940

Many map tiles were actually surveyed across a number of years with minor revisions made right up to the publication date. The project, therefore, mainly referred to the date of publication rather than survey dates. The publication date for each map tile came from metadata supplied by English Heritage.

The time gap between the Landmark digital maps and modern digital OS maps was largely covered by a set of OS paper maps at 1:10,000 published between 1971 and 1990, held by South Yorkshire Archaeology Service. As these maps were undigitised, comparison with other mapping was slower, but they did fill an important gap in the historic mapping. There were no smaller-scale maps, equivalent to the 1:2500 series, available for this date range, so less detail could be recorded for this time period. The more modern maps also tended to include less information about industrial processes, compared with 19th and early 20th century mapping. Industrial sites were more regularly described merely as ‘works’.

Mapping resources predating the Ordnance Survey coverage were largely restricted to occasional paper mapping sourced from archives. These were a mix of estate maps, tithe maps and Enclosure maps. These sources could not be referred to for the whole of South Yorkshire but proved valuable when specific questions needed to be addressed.

Written sources consulted as part of the project included local history books, archive documents, archaeological excavation reports and the South Yorkshire Sites and Monument Record (SMR). The excavation reports and other data held within the Sites and Monument Record were useful for the background historic and archaeological information they contained. These sources were readily available as the Historic Environment Characterisation project was undertaken by the South Yorkshire Archaeology Service, who maintain the South Yorkshire SMR.

Where there was little documentary or map evidence for previous landscapes, it was necessary to make decisions based on comparisons with similar, better documented landscapes. When available, Enclosure maps were useful in verifying these interpretations, where enclosure processes had been inferred by the morphological analysis of field patterns.

Digitisation Methodology

Broad Types and Historic Environment Types: As indicated above, the characterisation process begins by identifying physical patterns in the present landscape - from maps, plans and aerial photographs. GIS polygons are then drawn around areas with common characteristics; examples might include a large stand of ancient woodland, or an area of countryside featuring the characteristic straight boundaries of parliamentary enclosure. In urban environments each polygon may record a different type of housing layout, or a phase of industrial expansion. Each unique polygon is then allocated a 'broad' character type, as shown in Table 1. These 12 Broad Types can each then be subdivided into more specific Historic Environment Types, as shown in Table 2. A complete list of Broad Types and their Historic Environment Types, with scope notes, is found in Appendix I at the end of this report. These lists evolved from the types stated in the initial project design, as further categories were found to be necessary in the early stages of the project.

Broad Types	Description
Commercial	Business areas including retail and office units.
Communications	Main communication nodes. Linear features such as roads and canals are not generally marked, but the main features linking these are. Records areas such as train stations, transport interchanges, airports etc.
Enclosed Land	Land that has been demarcated and enclosed, particularly fields.
Extractive	Areas involved with the extraction of commodities and minerals such as fuel or building materials.
Horticulture	Area used for market garden, garden centres, orchards etc.
Industrial	Areas concerned with industrial processes and manufacturing.
Institutional	Areas (with or without buildings) connected to large establishments, associations and organizations.
Ornamental, Parkland and Recreational	Designed landscapes and open spaces used for recreational purposes.
Residential	Areas where people live. Ranges from large individual houses to housing estates.
Unenclosed Land	Unimproved land, open land, moorland, etc.
Water Bodies	Large water bodies including reservoirs and lakes. Does not include millponds.
Woodland	Land with dense concentrations of trees.

Table 2: Historic Environment Types

Where a proposed present-day polygon would cover an area with more than one previous historic environment type, two or more polygons were actually drawn, to allow this difference to be highlighted. As the current historic character is the same, these polygons will have the same Broad Type and Historic Environment Type but the database will record the variation in past character. An example of where this might happen is when a large 'private housing estate' covers land that had previously been 'terraced housing' and 'allotments'; in these circumstances two polygons will have been drawn. The first polygon will have a current Historic Environment Type of 'private housing estate' with a previous Historic Environment Type of 'terraced housing'. The second polygon will have a present type of 'private housing estate' and a previous type of 'allotments'.

Throughout the project, the *confidence* of decisions made about the historic character of each area has been recorded using the scale: *certain, probable, possible*. This has brought a degree of transparency into the characterisation process and allows general interpretations to be assessed on their likelihood.

Date of Origin: Each current character type and past character type recorded within the database is allocated a date of origin. With 19th and 20th century landscapes this will generally correspond to the earliest mapping that that character type is recorded on. Dates prior to the first edition OS mapping (c.1850) will have been given a specific date where this is known but will otherwise have been allocated a general date, depending upon the type of landscape involved. The dates 1066 and 1540 are typically used as the date of origin of medieval and post-medieval landscapes respectively; 1750 is often used for surveyed enclosure landscapes where no enclosure award data is known. These decisions were made based upon the specialist knowledge of the project officers. Where generalised dates are used, a measure of confidence in the dates should have been included; uncertain date ranges are qualified with a '?'. The inclusion of these generalised dates within the database allows 'estimated' pictures of past landscapes to be mapped. See Figure 2, below, for an example of such a map from the medieval period.

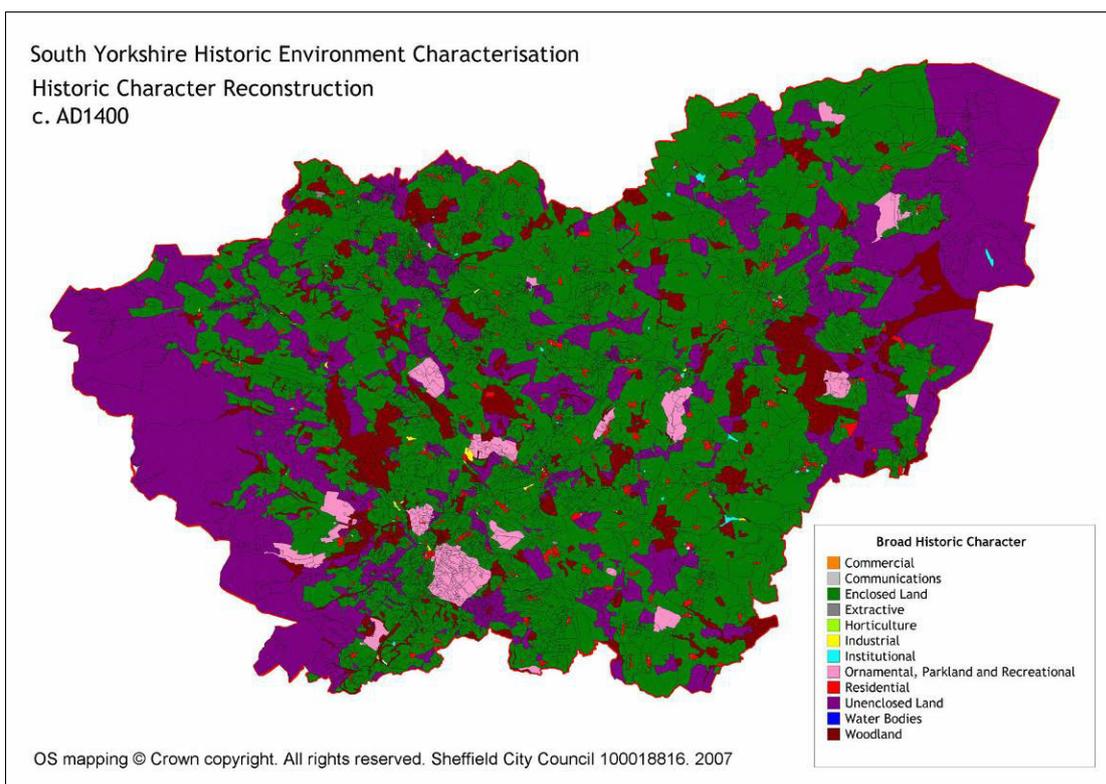

Figure 2: Generalised thematic map of South Yorkshire in AD 1400 (coloured by Broad Character Type)

Attribute Data: By using an integrated database and GIS it has been possible to attach a variety of attribute data to each polygon, allowing a variety of consistent attributes to be recorded quickly. Each Broad Type will have a different selection of attributes, e.g. for ‘Residential’ Broad Types the following attributes are recorded: *Housing Density, Layout Pattern, Private Open Space, Public Spaces, Status, and Legibility*; for ‘Unenclosed’ Broad Types, the attributes recorded are: *Elevation and Legibility*. The attributes recorded for each Broad Type are detailed in Appendix I and a full list of attributes, with scope notes, can be found in Appendix II.

Of the various attributes recorded within the project database, perhaps the most important to discuss in detail is *Legibility*. This attribute was developed specifically for the South Yorkshire project, as a way to describe how much of a former landscape survives, and can be read, within the present landscape. Examples might include former field boundaries preserved as garden boundaries within a housing estate, or industrial features, such as spoil heaps, surviving within an area now dominated by public recreational use. The extent of such legibility is recorded as *Significant, Partial, Fragmentary* or *Invisible*, depending on the ease with which such remains can be read in the modern landscape. Legibility refers to former historic character types recorded within the database for an individual polygon; details on the previous character type referred to should be documented within the database’s description field.

Working methods: For most of the project, two characterisation officers worked within the same district of South Yorkshire simultaneously. This was done to facilitate informed discussion on similarities and differences in perceived local character and to allow for the sharing of information. The project officers worked (approximately) in adjacent 10km grid squares. Barnsley, the final district to be characterised, was treated differently - the result of a change in project officers. It was decided that the new project officer should complete the remaining polygonisation of this district, whilst the other project officer went ahead with the analysis phase for areas they were already familiar with.

During the project the results of the ongoing characterisation were verified by making a number of rapid area visits. The aim of these field visits were to check the accuracy of attribute recording and descriptions on the ground.

Digitisation Rates

Testing during the pilot study showed that the polygon size necessary to define distinct character units varied according to the complexity and frequency of human action within a particular location. The pilot study indicated that in urbanised areas typical polygon sizes would be within the range of 5-10 hectares. In contrast, agricultural areas (typically various types of enclosed land) required polygons of, on average, 90 hectares. The mapping scales needed to record such units also varied. Where polygons are small, i.e. within urban areas, historic 1:2,500 or modern 1:2,500 'Landline' data sources were required. For rural areas, the historic 1:10,560 or modern 1:10,000 series mapping was sufficient. The flexible zooming and overlay capabilities of the GIS allowed these scales to be varied according to individual circumstances.

Working from the available data, South Yorkshire was considered to be subdivided into 128,590 hectares of rural land and 31,410 hectares of urban land. These figures were based upon the urban datasets available (derived from OS data) that included settlements with over 1,000 inhabitants. Following the initial pilot study, it was assumed that in rural areas character units would have an average area of 100 hectares and in urban areas an average of 7 hectares. This would have resulted in 1286 rural polygons and 4487 urban polygons - a total of 5773 polygons for the whole of South Yorkshire.

These early results also indicated that around 11 polygons a working day could be completed by each project officer, allowing for field tests, meetings and administration. This, in turn, suggested a digitisation period of 265 working days. With an allowance made for annual leave, sickness, etc. this meant the characterisation would take just under 15 months.

Part way through the project it was seen that these polygonisation rates were inadequate. On completion of the project (assuming 220 working days per year per project officer, to allow for holiday and weekends) the

polygonisation phase was calculated to have taken approx 1110 working person days. This gives a rate of polygonisation of **7.23** polygons (and an average area covered of 139.42 ha) per project officer per day.

Table 3 shows the actual number of polygons digitised, separating urban and rural units according to the urban dataset used to produce the original rates (in the pilot stage). Table 4 shows the breakdown based upon the types of Broad Type recorded for each polygon. This shows that the original urban dataset underestimated the amount of urban land within South Yorkshire.

	Area (ha)	Polygons	Average area per polygon (ha)
<i>Urban</i>	31,872.61	5104	6.24
<i>Rural</i>	122,878.39	2928	41.97
<i>Total</i>	154,751.8	8032	

Table 3: Polygonisation rates, where urban = settlement with population above 1000.

	Area (ha)	Polygons	Average area per polygon (ha)
<i>Urban</i>	37,536.07	5986	6.27
<i>Rural</i>	117,215.73	2046	57.29
<i>Total</i>	154,751.8	8032	

Table 4: Polygonisation rates, area of urban land based on Broad types. (Urban area = Residential/Commercial/Communications/Horticulture/Industrial/Institutional and rural Broad Types where they fall within towns)

Polygonisation rates can be further broken down by Broad Type, as shown below (Table 5).

Broad Type	Area (ha)	Polygons	Average area per polygon (Ha)
<i>Commercial</i>	2602.76	507	5.13
<i>Communications</i>	1347.03	136	9.90
<i>Enclosed</i>	78791.72	922	85.46
<i>Extractive</i>	5961.76	178	33.49
<i>Horticulture</i>	64.82	25	2.59
<i>Industrial</i>	4470.88	659	6.78
<i>Institutional</i>	3065.26	1040	2.95
<i>Ornamental, Parkland and Recreation</i>	8984.61	769	11.68
<i>Residential</i>	22886.51	3181	7.19
<i>Unenclosed Land</i>	16348.88	192	85.15
<i>Water bodies</i>	939.29	50	18.79
<i>Woodland</i>	9246.15	373	24.79
	154709.67	8032	

Table 5: Polygonisation rates by Broad Type

The key difference between the original polygonisation estimates and the final polygonisation results is in the degree of complexity in rural areas. The average polygon size for rural broad types is nearly half as small as was initially projected.

Analysis Methodology

In the later stages of the project, individual character units were grouped together into larger areas, so that similar historic developments could be described. The analysis phase of the project was undertaken district by district, so that the individual unitary authorities within South Yorkshire could receive appropriate local information.

Sheffield was the first district to be analysed. This work began with a bottom up approach, grouping individual polygons into Character Areas. These areas drew together associated units, generally of contiguous polygons. As a result, Character Areas will include polygons with different Broad Character Types, e.g. terraced housing will be grouped with contemporary allotments, schools and churches.

The defined Character Areas were then considered for similarities that could be grouped at a higher level. This led to the development of Character Zones that represent broad themes of landscape development.

This bottom up approach was found to be highly time consuming. It was then decided that a better approach would be to use the project officers' specialist knowledge of the landscapes of South Yorkshire - allowing them to develop a list of relevant Character Zones and then define Character Areas to match these (automatically assigning individual character units accordingly). By keeping the initial list of Zones flexible for each district this approach was found to work well. Zones could be added or removed to a district discussion, as themes of landscape development for that district were recognised.

Critique of the Methodology

The process of characterisation is inevitably one of subjective decisions. The European Landscape Convention, which was ratified by the UK government in 2006, states that “[l]andscape means an area, *as perceived by people*, whose character is the result of the action and interaction of natural and/or human factors” (*our emphasis*). Human perception provides a very personal view. Throughout this project it has been the intention to characterise the historic environment in terms of how an average person would perceive the character. This is in line with the guiding principals of characterisation (Clark *et al* 2004, 6). However, specialist knowledge may have led to the characterisation of some landscapes that would not be well understood by

members of the public. Where to generalise and where to go into detail, with smaller polygons, was also a subjective choice made by the project officers - using their knowledge and experience.

Such subjective choices can never be entirely removed from the characterisation process. This makes it important to document the decision making processes followed, allowing users or future developers of the database to judge the validity of our decisions, based on future knowledge.

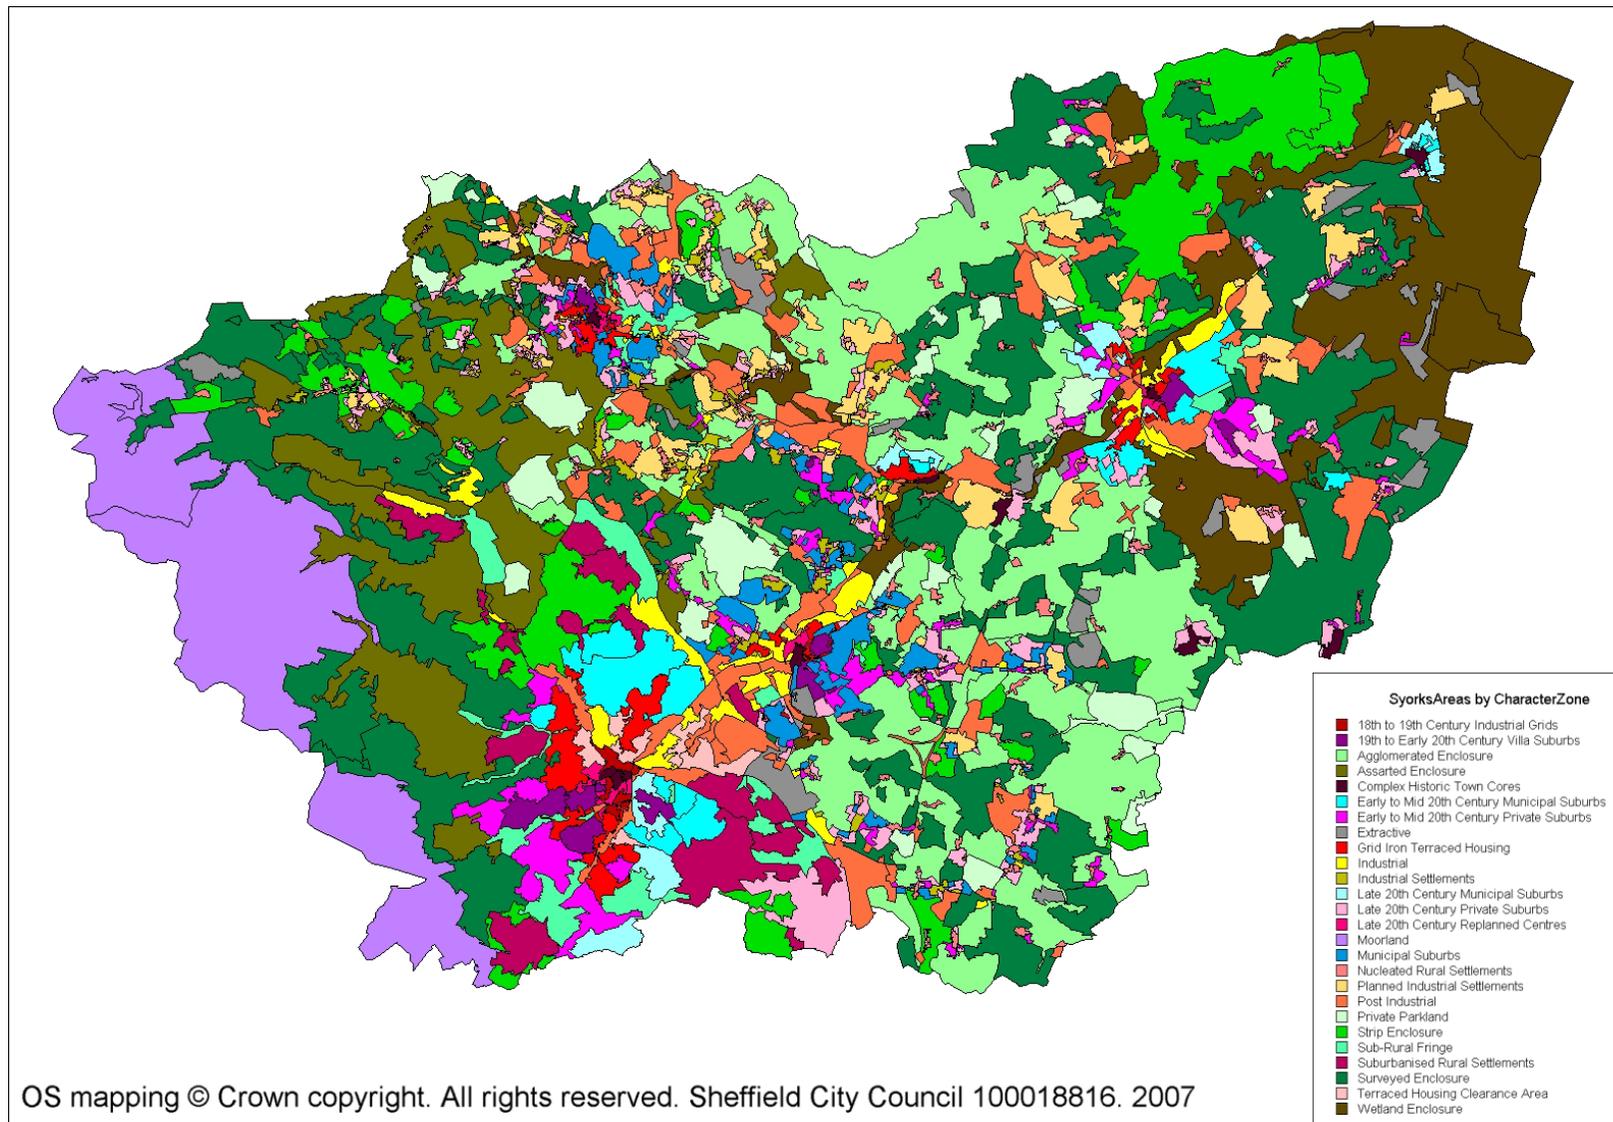

Historic Environment Types: Early use of the data from the South Yorkshire Historic Environment Characterisation project has indicated some difficulties with the Historic Environment Types. Some types overlap, making it difficult to pull all the relevant data from the GIS tables in a single query. An example of this is 'low rise flats'; these may either have been privately built or have been built as part of an area of social housing. In retrospect, it would have been more appropriate to make 'high rise flats' or 'low rise flats' an attribute within the *Private Housing* and *Planned Estate (Social Housing)* types, or for private or public to be recorded as attributes for *Low Rise Flats* and *High Rise Flats*. This detail could be added in as part of the future development of the database, if it was found to be useful.

Software: The South Yorkshire Historic Environment Characterisation project was one of the first projects to make use of the HLC module of the Exegesis HBSMR database (this database already held the Sites and Monuments Record for South Yorkshire prior to initiation of the project). The structure of the database system was, therefore, relatively untested. Through work on the project and analysis of project data some limitations in the system have become evident. One of the primary difficulties with the database is over the ability to export large amounts of data, for use by people outside of the Archaeology Service. The main difficulty comes with the exportation of attribute data, as the structure of the tables does not allocate a unique column position to each attribute type.

A feature that would be beneficial in future versions of the database would be the ability to score *Legibility* for each former landscape character, rather than having just one overall score. This would enable a user to pick out areas where a particular former character type is legible, e.g. areas of medieval open fields.

Despite the limitations outlined above, there have been benefits in using HBSMR, particularly in the seamless integration of project data with the existing SMR. This enables SYAS to easily put recorded sites into their landscape context.

Part III: Themed Results

Zones: Historic Developments within South Yorkshire

This project grouped South Yorkshire into 26 different Character Zones, which focus on the key historic developments that have left their mark on the landscape, as outlined within the Analysis Methodology above.

Character Zone	Overview
<p data-bbox="236 633 647 705">Moorland</p>  <p data-bbox="236 1014 647 1173">© SYAS</p>	<p data-bbox="647 633 1345 1173">This zone lies on the western edge of South Yorkshire in the Barnsley and Sheffield districts. Much of the zone lies within the Peak District National Park and has a wild and open character of blanket bog and heather moorland. Although seemingly <i>natural</i> in character this landscape is a product of human actions. The low vegetation has been maintained by sheep grazing and burning of the heather. Much of the land was divided up with long, straight, drystone walls in the 19th century to indicate ownership. Some areas are still actively managed for grouse shooting.</p>
<p data-bbox="236 1173 647 1245">Assarted Enclosure</p>  <p data-bbox="236 1554 647 1839">© Wendy North. Creative Commons License http://www.geograph.org.uk/reuse.php?id=890154</p>	<p data-bbox="647 1173 1345 1839">This zone is made up of ancient woodlands and ancient irregular enclosure patterns. The key characteristics of these enclosures are small, sinuous or rounded fields, with mainly hedged boundaries. Fields were often <i>assarted</i> from a wooded landscape at an early date; many fields date to the medieval period. Very little of the land was formerly part of a medieval open field system. The zone mostly lies across the lower and middle coal measures in Sheffield and Barnsley and the northern edge of Rotherham district. Alternating bands of shales, sandstone and coal seams have weathered to produce a rolling hilly landscape with steeper scarps in the west of the zone and where the River Don cuts through the area. Areas of woodland have often survived on these steeper slopes.</p>

Character Zone	Overview
<p data-bbox="236 259 478 297">Strip Enclosure</p>  <p data-bbox="236 667 598 763">Aerial Photos Cities Revealed aerial photography © the GeolInformation Group, 2002</p>	<p data-bbox="651 259 1340 741">This zone is located in the west of the districts of Sheffield and Barnsley, with a small scattering near the historic settlements in Rotherham. In Doncaster district the zone is found to the north of the River Don, in the Humberhead Levels Landscape Character Area. The landscape contains long thin curving fields often with reverse ‘s’ shaped boundaries. These fields developed from the gradual enclosure of medieval town fields, from the late medieval period onwards. Field boundaries are a mix of drystone walls and hedges containing mature trees.</p>
<p data-bbox="236 797 518 835">Wetland Enclosure</p>  <p data-bbox="236 1144 651 1272">© Ken McCann. Creative commons Licence: www.geograph.org.uk/reuse.php?id=673854</p>	<p data-bbox="651 797 1340 1099">This zone is predominantly found in the east of Doncaster district, taking in the wetland moors at Thorne and Hatfield and the surrounding drained enclosures. Also included are the river floor valleys in Doncaster, Barnsley and Rotherham districts. The enclosure patterns generally consist of regular, straight boundaries of hedges and ditches.</p>
<p data-bbox="236 1312 486 1350">Private Parkland</p>  <p data-bbox="236 1686 327 1720">© SYAS</p>	<p data-bbox="651 1312 1340 1973">This zone is scattered throughout the districts of Barnsley, Doncaster and Rotherham. It is found predominantly in a band running north south through the centre of South Yorkshire. The defining characteristic of this zone is the use of land as ornamental parkland from the 17th to the early 19th centuries. These areas of parkland often have clearly defined boundaries, separating them from the surrounding countryside - circuit walls or plantation woodlands that provide screening and enclosure. Most of the larger parks originated as deer parks and some, therefore, date back to the medieval period. The park landscape consists of a variety of permanent grassland maintained as pasture, or land managed for arable cultivation, and there are often plantation woodlands.</p>

Character Zone	Overview
	<p>The focal point of many of these parks is a large elite residence and related home farm complex, sometimes on the fringe of an older village. Design features are generally intended to emphasise the high status of their owners. Such features can include ornate gateways and lodges; tree lined avenues and curving driveways; architectural follies, statuary, fountains and summerhouses; artificial lakes and ponds; formal gardens; and kitchen gardens.</p>
<p>Surveyed Enclosure</p>  <p>© SYAS</p>	<p>In Sheffield and Barnsley districts this zone is concentrated in the west. The land here was often enclosed from open moorland in the 18th and 19th centuries, often under the authority of a Parliamentary Award. Within the districts of Doncaster and Rotherham the zone is more dispersed and takes in former moorland, commons and medieval open town fields. Surveyed enclosure landscapes are characterised by straight sided enclosures with hedged or drystone wall boundaries. There are often contemporary straight roads running through these field systems. The landscape is punctuated by dispersed farmsteads that are often contemporary with the enclosure.</p>
<p>Agglomerated Enclosure</p>  <p>© Nigel Homer. Creative Commons License: www.geograph.org.uk/reuse.php?id=116884</p>	<p>This zone is found in the districts of Barnsley, Rotherham and Doncaster and runs in a strip southeast to northwest across the centre of the county. Fields within the zone are predominantly used for large-scale intensive arable farming. This has been the cause of a significant loss of field boundaries in the late 20th century, as former divisions were removed to create larger, agglomerated fields. The remaining field boundaries are a mix of hedgerows and fence lines, sometimes with fences supplementing gaps in poorly maintained hedged boundaries.</p> <p>Despite this boundary loss, closer examination of this zone reveals an agricultural landscape largely planned in the medieval period and formerly part of the medieval open field system. Evidence for this earlier history</p>

Character Zone	Overview
	includes field boundaries and road patterns that exhibit the characteristic sinuous curves of former open field systems.
<p data-bbox="236 412 491 450">Sub-Rural Fringe</p>  <p data-bbox="236 792 647 920">© Mark Morton. Creative Commons License: www.geograph.org.uk/reuse.php?id=41661</p>	<p data-bbox="647 412 1345 1155">The historic character of this zone is defined by a landscape with strong rural indicators, such as open space, relict field boundaries, high levels of woodland and a general absence of housing or active industry. Nevertheless, the influence of nearby or surrounding urban settlement has fundamentally altered the character. These landscapes may previously have had an agricultural or industrial character (sometimes both), but their current management is generally concerned with maintaining their amenity value as green spaces, whilst encouraging opportunities for recreation and biodiversity. This zone is found within all four districts of South Yorkshire and is generally located on the edge of the major settlements of Barnsley, Sheffield, Doncaster and Rotherham, but is also found near Chapletown and Stocksbridge.</p>
<p data-bbox="236 1155 483 1227">Nucleated Rural Settlements</p>  <p data-bbox="236 1570 328 1608">© SYAS</p>	<p data-bbox="647 1155 1345 1675">This zone is widely distributed across Barnsley, Doncaster and Rotherham. Similar settlements within the Sheffield district have been considered as part of the surrounding countryside or within other urban zones. These settlements often date back to the medieval period and contain many buildings dating back to at least the 18th century. Road and property boundary patterns have altered little since they were first recorded in the 19th century and in many cases will date back to the medieval period. Some settlements retain a rural setting whilst others have been surrounded by later housing.</p>

Character Zone	Overview
<p data-bbox="237 255 590 331">Complex Historic Town Cores</p>  <p data-bbox="237 640 649 965">© Richard Bird. Creative Commons License: www.geograph.org.uk/reuse.php?id=639358</p>	<p data-bbox="649 255 1347 965">This zone takes in the urban centre of the city of Sheffield and the towns of Barnsley, Rotherham and Doncaster; in Doncaster district this zone also includes the historic cores of Bawtry, Conisbrough, Mexborough, Thorne and Tickhill. These historic settlements are similar in many ways to the Nucleated Rural Settlements, but they have a higher level of complexity. This complexity generally includes the presence of market places, castles and multi-phase planned layouts, all of which constitute evidence for deliberate acts of medieval planning. Buildings within this zone are often early in date, with many examples dating to at least the 18th century. Road and property division patterns tend to have altered little since they were first recorded in the 19th century.</p>
<p data-bbox="237 965 574 1003">Industrial Settlements</p>  <p data-bbox="237 1346 649 1709">© Steve Fareham. Creative Commons License: www.geograph.org.uk/reuse.php?id=785160</p>	<p data-bbox="649 965 1347 1709">Industrial settlements are found across the districts of Barnsley and Rotherham. Within the district of Sheffield this type of settlement was considered within the Suburbanised Rural Settlement zone. Industrial Settlements are often irregular in layout and are positioned along a road or on an area of former common. Housing largely consists of terraced housing. This type of settlement is generally associated with early coal mining. However, they are also associated with other industries characteristic of the region, such as iron, steel and brass working, glass making, ceramic production, brick making and the railway trades. These settlements have not been recorded within Doncaster as here many industrial villages were established at a later date, when settlements were more highly planned (see Planned Industrial Settlements Zone).</p>

Character Zone	Overview
<p>18th to 19th Century Industrial Grids</p>  <p>© SYAS</p>	<p>This zone has been considered separately to other industrial zones within Sheffield because of the significant impact these early industrial developments had on the development of the city and the impact that the layout of their streets still has on the current townscape. Typical early development included both mixed-use light industrial buildings, typically connected with cutlery and tool making - often built as workshop ranges around rectangular central courtyards, and high density residential properties - often built back-to-back around domestic courts. Many of these domestic buildings were cleared in the early 20th century.</p>
<p>19th to Early 20th Century Villa Suburbs</p>  <p>© SYAS</p>	<p>This zone is found in the districts of Sheffield, Barnsley, Doncaster and Rotherham and generally lies on the edge of the principal urban centres. The housing here developed in the 19th century, as middle class suburban developments away from the industrial and commercial city centres, which were becoming increasingly densely developed. These suburbs consist of detached and semi-detached houses, which tend to be fairly well spaced, and roads are often lined with mature trees.</p>
<p>Industrial</p>  <p>© Alan Murray-Rust. Creative Commons License: www.geograph.org.uk/reuse.php?id=799149</p>	<p>Industry formed a very important part of the history of South Yorkshire, focussing on the river valleys of Barnsley, Doncaster, Rotherham and Sheffield from the medieval period onwards. This zone consists of a mix of late 18th or 19th century (largely disused) industrial sites and modern factories. The industries range from small water-powered mills to large industrial complexes housed in long metal sheds. Not all current industry is included within this zone as many modern industrial units are sited on mixed business and industrial parks and so have been considered within the Post Industrial zone.</p>

Character Zone	Overview
<p data-bbox="236 255 647 293">Grid Iron Terraced Housing</p>  <p data-bbox="236 633 647 672">© SYAS</p>	<p data-bbox="647 255 1343 965">This zone is found extensively in the city of Sheffield. It is also concentrated around the principal urban centres of Doncaster, Barnsley, Rotherham and Mexborough. The rate at which many of these areas of housing were built shows the rapid growth of the industrial populations of South Yorkshire. Terraced housing was being built before the establishment of many of these grids, in the mid 19th and early 20th centuries, but generally not on the large scales of these areas or with a grid street pattern. Houses are often very uniform, due to the development of bylaws that controlled housing size. Houses often still have their outside toilets, which were either accessed by a back lane running along the rear of the housing or by alleyways running through the terrace at intervals.</p>
<p data-bbox="236 965 647 1039">Terraced Housing Clearance Areas</p>  <p data-bbox="236 1368 647 1406">© SYAS</p>	<p data-bbox="647 965 1343 1525">This zone is located predominantly on the northern edge of Sheffield city centre. The landscape is characterised by large areas cleared of 19th century terraced housing during the middle to late 20th century. Most of these areas now feature late 20th century municipal housing, often system built estates constructed in materials new in the 1950s and 60s; from the mid 1970s onwards more traditional estates of low rise housing have been common developments. However, many 19th century elements survive, such as street patterns, institutional buildings, public houses and some housing.</p>
<p data-bbox="236 1525 647 1563">Extractive</p>  <p data-bbox="236 1870 647 1989">© Alan Murray-Rust. Creative Commons License: www.geograph.org.uk/reuse.php?id=293145</p>	<p data-bbox="647 1525 1343 1989">This zone is predominantly found across the coal measures in the districts of Barnsley, Rotherham and Doncaster, with outlying areas on Doncaster's gravels and sandstones. In the recent past extractive industries dominated many landscapes of South Yorkshire. This zone represents the collieries and large quarries still active in 2003, or former extractive areas as yet unreclaimed. These sites often contain large spoil heaps, winding gear and other surface structures.</p>

Character Zone	Overview
<p data-bbox="236 255 518 331">Planned Industrial Settlements</p>  <p data-bbox="236 638 598 728">Aerial Photos Cities Revealed aerial photography © the Geoinformation Group, 2002</p>	<p data-bbox="647 255 1340 1227">Planned industrial settlements are found within Barnsley, Rotherham and Doncaster districts. Within Sheffield, this settlement type has been considered within the Suburbanised Rural Settlement zone. Like Industrial Settlements, housing within this zone has a highly significant connection with industry, particularly with coal mining. These settlements tend to have a geometric plan with green spaces at the centre of circular road layouts. The houses are generally semi-detached or built in short rows. These types of settlements were originally established in the early 20th century although many went on to expand further in the later half of the century. Examples further east often have the most complete planned layout because they were new settlements specifically built for the early 20th century exploitation of deep coal seams. Further west many were expansions of existing industrial settlements, developed at an earlier stage to exploit the shallower coal seams that runs through South Yorkshire’s coal measures. These developments predate the ‘garden suburb’ design ideas of the early 20th century.</p>
<p data-bbox="236 1227 630 1303">Early to Mid 20th Century Private Suburbs</p>  <p data-bbox="236 1646 647 1769">© Mike Fowkes. Creative Commons License: www.geograph.org.uk/reuse.php?id=128910</p>	<p data-bbox="647 1227 1340 1966">This zone is found within the districts of Barnsley, Doncaster, Sheffield and Rotherham. This zone is characterised chiefly of small areas of housing developed speculatively between 1914 and 1945 in small estates or as areas of ribbon development on the edges of existing settlements. These types of suburbs are often located on the edges of larger settlements and are particularly large on the western limits of Sheffield. Stylistically, developments in South Yorkshire during this period have much in common with areas developed in the Municipal Suburbs and Planned Industrial Settlements zones. Differences are likely to include larger housing units with more variety of housing types along individual streets, and an increased number of status differentiating features such as hung tiles, bay windows, stained glass and street trees.</p>

Character Zone	Overview
<p data-bbox="237 257 630 331">Early to Mid 20th Century Municipal Suburbs</p>  <p data-bbox="237 663 327 689">© SYAS</p>	<p data-bbox="649 257 1343 925">This zone is found within Sheffield and Doncaster where early municipal housing developments have been considered separately from those established in these districts in the late 20th century. This differs to the discussion of zones of municipal housing in the rest of South Yorkshire, primarily because of the larger numbers of municipal suburbs built on the edges of Sheffield and the clear differences between the early and later developments in Sheffield and Doncaster. Housing within this zone tends to be built in radial patterns with semi-detached properties or short row terraces, patterns that have much in common with the Planned Industrial Settlements found across South Yorkshire. There are also many similarities with contemporary private housing developments.</p>
<p data-bbox="237 965 512 1003">Municipal Suburbs</p>  <p data-bbox="237 1303 649 1429">© Steve Fareham. Creative Commons License: www.geograph.org.uk/reuse.php?id=583235</p>	<p data-bbox="649 965 1343 1447">This municipal housing zone is found within the districts of Barnsley and Rotherham. Within Sheffield and Doncaster the zone has been separated into early and late municipal suburbs. Early 20th century estates tend to be built in radial patterns with housing consisting of semi-detached properties or short row terraces; in Rotherham and Barnsley this pattern of housing tends to continue into the late 20th century. There are significantly fewer examples of large system built concrete blocks of flats in these districts, compared with Sheffield and Doncaster.</p>
<p data-bbox="237 1487 515 1561">Late 20th Century Municipal Suburbs</p>  <p data-bbox="237 1904 649 1998">© Incurable hippie. http://creativecommons.org/licenses/by-nc/2.0/deed.en_GB</p>	<p data-bbox="649 1487 1343 1968">This zone is located in Sheffield and Doncaster and consists of areas of concrete blocks of flats. Those within Sheffield tend to be built on a larger scale, because of the higher population within the city. There are significant differences between many municipal and private developments built during this period, with municipal housing developments showing a shift in emphasis from enclosed private gardens to unenclosed communal spaces - accompanied by the increasing segregation of pedestrian routes from road systems.</p>

Character Zone	Overview
<p data-bbox="236 264 526 331">Late 20th Century Replanned Centres</p>  <p data-bbox="236 689 327 721">© SYAS</p>	<p data-bbox="647 264 1340 667">This zone is found near the urban cores of the towns of Doncaster, Barnsley, Rotherham and the city of Sheffield. The land in this zone generally underwent a fundamental character change in the period 1945-1977. The dominant theme of this change was urban renewal, with areas generally cleared wholesale of earlier buildings and street patterns. Concrete office blocks, underpasses, large dual carriageways and new commercial developments are key features of this zone.</p>
<p data-bbox="236 766 635 833">Late 20th Century Private Suburbs</p>  <p data-bbox="236 1160 327 1191">© SYAS</p>	<p data-bbox="647 766 1340 1169">This zone is widely dispersed across the districts of Barnsley, Doncaster, Rotherham and Sheffield and is found within nearly all settlements, often located on their edges. In rural areas these developments are often built for modern commuters, but suburban expansion of larger urban settlements is also found. Houses tend to be semi-detached or detached with most properties having their own drive; road patterns are generally cul-de-sacs. Housing styles are similar across the region.</p>
<p data-bbox="236 1236 534 1303">Suburbanised Rural Settlements</p>  <p data-bbox="236 1653 327 1684">© SYAS</p>	<p data-bbox="647 1236 1340 1751">This zone is located in the district of Sheffield. Similar settlement types with Barnsley, Doncaster and Rotherham have generally been separated into the Industrial Settlements and Planned Industrial Settlements zones. These settlements often began as small rural villages that greatly expanded from the mid 19th century onwards. Later developments around the historic core are often built in geometric patterns with green spaces at the centre of circular road layouts. The houses are generally semi-detached or built in short rows. There are, however, quite diverse housing styles with terraces and vernacular cottages.</p>

Character Zone	Overview
<p data-bbox="237 259 459 293">Post Industrial</p>  <p data-bbox="237 607 651 777">© Steve Fareham. Creative Commons: www.geograph.org.uk/reuse.php?id=523275</p>	<p data-bbox="651 259 1351 777">This zone is located in the districts of Barnsley, Rotherham, Sheffield and Doncaster. The zone is generally found along the river valleys on land that was formerly used by industry or coal extraction. There are also concentrations of this zone near to the main roads and motorway junctions across South Yorkshire. The zone is dominated by late 20th century landscapes of retail, distribution, leisure, light industry and transport. This is an expanding zone of very modern character but one that often retains influences of past landscape types.</p>
