

## **AREA G - LIA/Roman pottery Summary by Joyce Compton**

**Introduction:** 261 contexts producing pottery were recorded, excluding cleaning and machining layers. A total weight of 245187g was recovered dating from the Late Iron Age to the late 4th century. The area is the most north-easterly of those excavated in Area AI. Most of the later deposits appear to have been removed during machining and excavation seems to have been piecemeal resulting in a lack of datable sequences.

**Linear features:**

**Structures:**

**Pits:**

**The pottery:**

**Quantified groups:** Eighteen contexts (7061, 7086, 7112, 7119, 7123, 7151, 7152, 7166, 7168, 7178, 7179, 7181, 7186, 7268, 7269, 7310, 7390 and 7559) were selected for study by Eves and of those fifteen were considered suitable for publication. The low number of selected contexts reflects the poor quality of the pottery recovered and the lack of cohesive well-dated groups.
