Non-Technical Summary

This document is the final report on the results of an archaeological excavation conducted on the site of Cabin Hill Farm, a 19th century farmhouse situated at the southern end of St. Lukes Church Road, Formby, Merseyside. The project was undertaken as a community archaeology event in partnership with the Sefton Coast Landscape Partnership.

The site is located to the south-west of Formby in an area of woodland and sand dunes. Map and census evidence suggests that the farmhouse was constructed sometime between 1850 -1861 as a single storey thatched cottage in longhouse form.

In the early 20th century Cabin Hill was occupied by Joseph Formby who is believed to have farmed asparagus in nearby fields until the late 1930s. The area was heavily militarized during World War II and it is likely that this was when the farm was abandoned. The site fell into decay after the war but was periodically occupied by the homeless. It is shown partially roofless on a sketch drawn in 1959 and was finally demolished in c. 1980.

The excavation found that at the northern end of the house the foundations and internal floors to the northernmost rooms survive. The floors were constructed in a range of materials including tile, cast concrete and concrete flags. The chimney stack was constructed in brick and retained evidence for the hearth. The layout of floor surfaces suggests that the area north of the stack was sub-divided into at least two rooms, possibly a kitchen and a pantry. The external walls appear to have been relatively insubstantial consisting of cement render over a timber frame clad in horizontally laid wooden cladding. Subsequent excavation showed that the rooms to the west of the stack were less well preserved, though areas of flooring did survive.

There was some evidence which suggests that the existing building may have been built over earlier foundations, possibly dating to the 17th/18th centuries. Five sandstone padstones with cut rectangular sockets, for upright timbers, were uncovered below an existing timber surface indicating possible foundations to an earlier structure.

An Archaeological Excavation at Cabin Hill, Formby, Sefton. Site Code 125 Final Report

1. Introduction

This report describes the results of an archaeological excavation conducted on the site at Cabin Hill, a 19th century farmhouse situated on St. Luke's Church Road, Formby, Merseyside. It is an update of the original report (Ahmad and Adams 2013) which covered only the four trenches excavated in the first phase.

The project was undertaken as a community archaeology event for the Sefton Coast Landscape Partnership.

The cooperation of the landowner, Natural England, in agreeing to allow access for this project is gratefully acknowledged.

2. The Site

The site is located at NGR SD 285 052 (centred) to the south-west of Formby, Sefton, in an area of woodland on the eastern fringes of the coastal dune belt (Fig. 1). The surrounding environs consist of farmland to the north and east and Altcar Rifle Range to the south.

The underlying geology consists of drift deposits of wind blown dune sand over glacial till.

3. Methodology

Fieldwork was undertaken on 25 - 30 April 2013 and 11 – 14 September 2013.

A full Project Design was not produced for this project which was conducted as a Community Archaeology project under the wider Sefton Coast Landscape Partnership (SCLP). Outline methodologies were produced as part of the original planning of the Community Archaeology project.

All excavation was by hand and was restricted to exposing *in situ* walls and floors.

The principal aim of the excavation was to allow amateur access to archaeological fieldwork and to provide training in basic archaeological methods.

The principal archaeological aim was to determine the construction sequence of the house.

In addition it was intended to record the internal layout of the building and surrounding garden features.

No spot heights were taken during the planning phase of excavation due to the absence of a nearby bench mark.

The excavation was project managed by Mark Adams, assisted by site supervisor Clare Ahmad from Archaeological Services National Museums Liverpool (ASNML, formerly National Museums Liverpool Field Archaeology Unit).

Will Moody and Fiona Sunners from Sefton Coast Landscape Partnership provided support along with Alison Burns, Joanne Chamberlain and Margaret Connor.

Volunteers were Rachel Backshall, Chloe Ball, Sarah Banks, Meg Blanchard, Lee Bretherton, Jude Campbell, Matthew Carver, Alan Cooper, Dave Cox, Ann Cox, Dawn Dixon, Denise Dutton, Stewart Eccles, Denise Franklin, Ian Fyles, Ged Gallagher, Peter Gorman, Martin Horton, Carl Hewitt, Alexandra Keating, Andrew Kemp, Elaine Langley, Alex Livesley, Richard Hayden, Laurel Maguire, Peter Maguire, Lynn Moran, Joanna Munro, Sue Munro, Suzanne Price, Mike Rothwell, Christine Settle, John Settle, Susan Smith, Andrew Stockell, Linda Stubbs, Joanne Swift, Karen Taylor, Irene Rawcliffe, Tracy Whitehead, Aaron Whitehead Liz Williams, Ronny Williams and Trevor Williets.

Apologies to anyone omitted, any omissions or mistakes are the author's.

In addition to those taking part directly the excavation was visited by many local people, some of whom remembered the farmhouse and previous occupants. Pupils from a local primary school also attended a session aimed to provide them with an opportunity to participate directly.

4. Archaeological and Historical Background

No desk-study was conducted for this project; the following notes were compiled from readily available published documentary sources, historic images and maps.

The site is located in an area of sand dunes stabilised by the planting of trees in the 19th century. It lies on the south-western fringes of the modern town of Formby and mapping from the late 18th to mid 19th century shows the site as sand dunes whose only economic use was as rabbit warrens and asparagus farming.

There is documentary evidence that the site lies on or close to the site of Old Formby, the precursor to the modern town, which was overwhelmed by sand dunes in the Late Medieval to early Post-Medieval period. The placename suggests that the settlement had Norse origins, though earlier activity cannot be ruled out. Evidence from leases, indentures and a map drawn in the mid-16th century suggests that the village was centred in the area to the south and west of the modern church of St Luke's which would place it broadly in the area around Alexandra Road and Albert Road, though its precise nature and extent remains poorly understood.

However, any deposits relating to these earlier periods is probably deeply buried below deposits of wind blown sand and were unlikely to be exposed by the present fieldwork.

The enclosure surrounding the site is shown on the 1st Edition OS 6 inch to the mile sheet, surveyed 1845 – 6, published 1848, although no buildings are shown (Fig. 2) and it does not appear on the Formby Tithe Map of 1850. The later 1st Edition 25 inch to the mile OS sheet, surveyed 1892 and published 1893 clearly shows the farmhouse and associated outbuildings (Fig. 3) and this remained largely unchanged until the site was abandoned.

The earliest evidence for occupation at the site is the census return for 1861 which lists the occupants of Cabin Hill Cottage as 'Mary Formby, aged 64, Farmer of 5 acres, together with unmarried daughter, (aged not legible), Mary Formby's son aged 42, labourer, his wife Sarah aged 34, grandson, John, aged 4, granddaughter Jane aged four, grand son Joseph, age 2, and that another granddaughter Margaret Sidon, aged 15' (R. Yorke pers. Comm.).

The Formby's continued to occupy the site until at least c. 1900 -1910 when the photograph in Fig. 4 was taken. This shows the then occupiers of the house, Joseph Formby, a woman presumed to be his wife, and a child. The house is a rendered single storey 'long-house' form with a chimney stack at the northern end and what appears to be a thatched roof. There are two doors, one at the north end, one to the south and it is possible that the unheated southern end was used as a barn or byre.

The site was visited during the excavation by Mr Formby the owner of the photograph used in Fig. 4. His father had taken over the farm during the late 1940s and continued to occupy the site into at least the late 1950s because the rent on the farm was so low. He was very clear that the site had not been abandoned because of WW2 but because of the sand extraction had destroyed the asparagus fields around Cabin Hill.

He remembered that the western rooms were used as bedrooms but was unsure about the use of the eastern end, but agreed that it was probably the kitchen. However, he was clear that the main living room was in a separate brick structure south of the farmhouse. This apparently contained a 'range' used as a cooker.

Mr Formby also remembered a door through the wall represented by the padstones to the bedrooms to the west. The tiled floor may have been carpeted.

During World War II the area around the farm became heavily militarised. The farm lay on or close to a 'Starfish' decoy site used to divert bombers from Liverpool's Docks. A sketch by Murial Sibley in 1959 (Fig. 5) suggests the farm had been abandoned around this time as it shows the eastern end cottage roofless. A pump in the foreground is likely to be for water and a roofed structure is shown in the foreground. However, it is difficult to reconcile the perspective of this drawing with that of the photograph in Fig. 4 and it is possible that this is a composite view.

5. Results of the Excavation

The locations of trenches are given in Fig. 5 though deposits are only referenced to trenches for the purposes of location.

Trenches I & IV directly abutted each other and are shown on Fig. 7 as a single entity.

Trench I/IV

Trenches I and IV were excavated separately but were adjacent and with contiguous deposits so are described together. In total the excavated area measured c. 13.00 m by 5.50 m and was situated at the eastern end of the cottage.

A c. 0.15 – 0.30m deep deposit of topsoil mixed with demolition debris consisting of a compacted mix of brown, humic sandy loam containing late 19th/20th century brick

rubble, glass bottles, jars, pottery and other modern debris (contexts 1, 28, 29 and 31) covered the interior of the building but did not spread outside its walls. Context 2/29 lay outside the building and was an accumulation of compacted mid-brown, humic sandy loam topsoil.

A number of internal floor surfaces and a complex of brick wall features were exposed after the removal of context 1 (Plate 1).

The walls of the east end of the farmhouse consisted of contexts 6, 7, 8, 38 and 39. Context 6 consisted of the stub of a portland cement wall with occasional half bricks. The cement was in fact a render which retained the impressions of the wall's timber framework which had decayed away. The timbers had been laid horizontally and measured c. 1.25 m (length) by 0.07m (thick) (Plate 2). It was not clear if the timber was just cladding or part of a frame. The *in situ* render of context 6 measured 3.60 m (length) by 0.36 m (height) by 0.06 m (thick). Context 7 butted wall 6 and was of a similar construction and measured 4.50 m (length) by 0.32 m (width) by 0.20 m (height). The northern wall context 8 butted wall 7 and was constructed using the same materials. It measured 5.00 m (east to west) by 0.20 – 0.35 m (width, widening to the east).

The best preserved structural feature was the base of a brick chimney stack with the remnants of an *in situ* cast iron fireplace and a tiled hearth (contexts 17, 19 and 12) (Plate 3). The partial base of a cast iron fireplace context 12 was still attached to the base of the stack and measured 0.26 m width by 0.02 m thick. Immediately behind context 12 lay a hearth context 17 consisting of fine grained sandstone and black tiles measuring a total area of 0.87 m (length) by 0.60 m (width).

A concrete floor context 3 was exposed in the south-east corner of the building and measured 2.65 m (east – west) by 2.57 m (north to south). The concrete slab had been cast in two sections, the outer section showing traces of red paint, and was probably laid as a kitchen floor.

A gap in the southern wall corresponds with the entrance visible to the right of the building on Fig. 4.

Four dimpled concrete flags and concrete surface, context 9, were present at the north-east corner of the building measuring 0.61 m² by 0.04 m depth, bonded with portland cement. This was the floor to a small room and due to the cooler location on the north side of the building was possibly used as the pantry area.

Another area of concrete and a concrete flag, context 10, lay c. 1.60 m to the west of context 9 and measured in total 0.98 m by 0.88 m by 0.04 m depth. The concrete flag was of a standard size 0.61 m² by 44 mm depth.

The base of a slight timber and plaster partition wall survived between concrete floor surfaces 3 and 9. Context 16 consisted of loose, mid-brown, sandy soil mixed with 45% decayed timber and 45% lime plaster measuring 2.00 m (east to west) by 0.15 m width. This probably divided the 'kitchen' from the 'pantry'.

Lying between contexts 9 and 10 was the partially decaying remains of a timber floor surface, context 11, which showed traces of red paint surviving at the western end possibly relating to context 10. The area exposed measured 2.48 m (east to west) by 1.90 m (north to south) with surviving timber planks measuring up to 0.23 m across. A large tree root was observed running north-west – south-east through context 11.

Another section of timber floor context 15 lay adjacent to the southern entrance. The surface consisted of a mix of humic matter and timber planks up to 0.17 m across. The area exposed measured 1.70 m by 1.33 m and traces of red paint were visible. Later excavation showed the timbers ran below 3 the concrete floor surface context and was therefore of earlier date.

Outside the house, below context 2, lay the remnants of modern red lino context 20 which had been laid as a path to the eastern door of the building. This overlay, and partially obscured, a concrete slab context 21 which showed traces of faded red paint on the upper surface. The slab measured c. 1.27 m (length) by 0.97 m and had a visible depth of between 40 – 70 mm.

Immediately east of contexts 20 and 21, and also lying directly below context 2, was a red brick garden path, context 24, running east to west, parallel to the south wall context 6 (Plate 4). The path was not fully exposed and appeared to continue into the eastern trench section. The path measured 4.05 m (length) by 0.87 – 1.01 m (width) and consisted of a single layer of bedded bricks. The handmade bricks measured on average 0.22 m by 0.10 m. The path was edged with a line of quarry tiles and bricks to the north and south contexts 22 and 23. The tiles were laid on edge to form a kerb and ran in an east to west alignment. Context 22 to the south side ran the full exposed length of the path and had remained more intact than context 23 to the north where only two tiles and four bricks in total lay at either end of context 24.

Context 29, a layer of topsoil, covered the continuation of a laid path (context 32) of brick and stone slabs on the southern side of the house. The path was c. 1 m wide, aligned east – west and was exposed for a length of over 5m in length. It was edged with timber to the south and red quarry tiles to the north. A 0.75 m section of brick path (context 33) was exposed butting context 32 at a 90° angle, running southwards towards a well at c. 4m distance (Fig. 7 & Plate 9).

The remnants of a flower bed (context 34), immediately adjacent to the northern edge of the path, ran for its full length and was 0.90 m wide. A 1919 copper alloy ha'penny was found at the far western end of 34 during cleaning.

The concrete slab and timber floor surfaces (contexts 9 and 11) in the 'pantry' area were lifted revealing three pad stones, measuring between 0.26 – 0.40 m (length) by 0.16 – 0.22 m (width), positioned within the natural dune sands context 26 (Plate 5). The remnants of two floor timbers running east – west were also observed in close proximity to the western pad stones. The padstones were in a medium grained mid-yellow sandstone and had sockets cut within the upper surface measuring on average 70 mm x 40 mm x 25 mm deep for timber posts. Three more padstones were almost immediately found when a silty sand infill, context 18, was excavated between the south wall context 6 and concrete floor slab context 3. Their position in relation to the marks of posts in the cement render showed that that end of the cottage had been rebuilt (Plate 6).

The stones were probably needed because posts set into conventional post-holes would probably have shifted in the soft sands. A number of sherds of early 19th century pottery and a brass button were also recovered below the floor surfaces.

To the west of the chimney stack the remnants of a quarry tiled floor (context 40), was exposed after the excavation of 28. Approximately one third of the tiled surface had survived on the eastern side due to the presence of a large tree stump and thick matting of roots which had largely obscured this area. The remaining floor area to the west had presumably been robbed out. The tiles were laid out in a diamond pattern

of dark grey and red and were bonded with portland cement. The tiles on average measured 0.23 m² by c. 0.10 m depth (Fig. 7 & Plate 10).

There were a number of *in situ* triangular fragments of quarry tile set in mortar located against both the southern and northern walls indicating that the floor had covered the full extent of the house within of Trench IV.

The west facing fireplace (context 42) was exposed along with a stone slab hearth context 41 overlaid by an enamelled steel sheet decorated with a vivid green and white chequered pattern surrounded by a repeated fleur de lis design (Plate 11). The function of a small recess to its south (context 13) was not clear.

Six sandstone padstones (contexts 36, 37 and 43) with cut rectangular sockets, presumably for upright timbers, were also sealed by topsoil 28 but had presumably been originally beneath the tiled floor. Four of the padstones (context 36) were aligned north - south towards the centre of Trench IV and were evenly spaced between at c. 0.50 - 0.60m apart. These were probably the foundations for a dividing interior wall. A further two padstones (context 37) were identified below wall 38, 0.50m apart, and were probably contemporary with 38 (Plate 12). One other padstone context 43 was exposed at the porch entrance to the farmhouse on the western side and was also socketed. This padstone was partially obscured by a tree root and measured c. 0.50m by 0.28m. As in Trench I, these padstones may relate to the foundations of an earlier structure.

Trench II

Trench II measured 2.00 m x 1.00 m reaching a maximum depth of c. 0.60 m and was located across the eastern bank of the site boundary (Plate 7). Topsoil was removed to a depth of c. 0.10 m below which lay loose grey/yellow sand and a rotted fence post *in situ*. One fragment of modern brick and an iron nail were found but not kept.

No further excavation was carried out and no significant finds were recovered.

Trench III

Trench III measured 1.5 m² reaching a maximum depth of c. 0.60 m and was aimed at locating an outbuilding south of the farmhouse (Plate 8). The only deposit present was pale grey, heavily rooted sands, context 25/27, containing 19th/20th century pottery, ironwork and one granite sett.

No further excavation was carried out and no significant finds were recovered.

6. Finds

The vast majority of the finds consisted of fragments of architectural ironmongery and 20th century debris typical of abandoned demolition sites and will not be reported upon in detail. All finds were discarded after assessment.

7. Conclusions

Given the house's insubstantial construction, the below ground deposits at Cabin Hill are relatively well preserved. The finds and structural evidence is broadly consistent with the census and map evidence which suggests a construction date of c. 1850-

1860. However, the cottage had been built to a 'longhouse' plan which in the absence of the map evidence would imply a much earlier construction date, possibly pre-1750.

In general the cottage was flimsily constructed with walls no more than 0.25 m in thickness constructed using timber scantling clad with cement render on the exterior. The nature of the internal surfaces could not be determined. In essence this form of construction is based upon the wattle and daub construction found in medieval and earlier buildings, and the dating evidence suggests that this was one of the last buildings constructed in Formby using this technique.

The post-pads for vertical timber posts found below the late 19th/early 20th century floor levels hint at an earlier phase of occupation and it is conceivable that this pre-dates the building shown on OS mapping, there is evidence elsewhere in Formby for the reoccupation of earlier sites and Cabin Hill may follow this pattern. The most likely scenario is that Cabin Hill was one of the last of this type of building to have been constructed in the region.

8. Recommendations for Additional Work

No further fieldwork or assessment is required.
