ART. XIX.—*Local Stone and Bronze Implements.* By  
LT.-COLONEL O. H. NORTH, D.S.O., F.S.A.

I REGRET that a mistake was made in my last article on Stone Implements (these *Trans.* N.S. xxxvi). I described a stone hammer found near Woodedge Farm, Beetham, and gave a drawing and section of it on p. 131, but the wrong photograph was inserted in the plate facing p. 130. This photograph refers to another stone hammer which I will now describe. The photograph (fig. 1) in this article is the one of the Beetham hammer.

1. A small stone hammer found at Hincaster by Mr. H. Prickett, who lent it to me for record and exhibition. Cavities are worked on either face, but do not go right through the stone. At first sight this would appear to be an unfinished implement, but from the numbers which have been found, it would seem that they are intentional and complete, and probably meant to be held by the finger and thumb, and not hafted (see Evans, *Stone Implements*, p. 238. Fig 1, these *Trans.* N.S. xxxvi, p. 130).

2. Stone Axe Hammer found at Ninezergh by Mr. William Bennett, who lent it to me for exhibition and record. It weighs  $5\frac{1}{2}$  lbs., is  $7\frac{1}{2}$  inches long,  $4\frac{1}{2}$  inches greatest breadth and  $2\frac{3}{4}$  inches thick. The hole is hour glass shaped and nearer the sharpened end. It looks as if it has originally been longer and had been broken and roughly re-sharpened. Fig 2.

3. A lozenge-shaped arrow head beautifully worked on both faces. These lozenge-shaped arrow heads are rarer than the leaf-shaped ones, and this specimen was found by Mr. C. Fishwick in Yealand in 1936. In my article on *Local Stone Implements*, *Ibid.* N.S. xxxiv,

describing axe heads found near the Leighton Mosses, I ventured to suggest a working site there, near a spring of fresh water. Last year Mr. Fishwick ploughed the field near the spring. I asked him to look carefully for any stone implements, and was very pleased when he discovered this perfect little arrowhead. Fig. 3.

4. Bronze Socketted Celt from Cowan Bridge. This is in the Lancaster Museum, and the Curator very kindly lent it to me to exhibit to the Society.

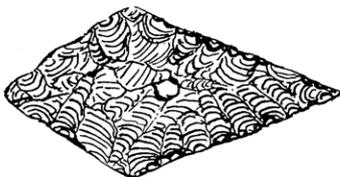

FIG. 3.

It was given to the Museum by Mr. G. H. Hugginson of Cowan Bridge. Unfortunately he could not tell me where it had been found, but said that it had been knocking about in the carpenters' shop for a long time, and was doubtless found in the vicinity.

It is very like the one I found at Newton Hall and described in these *Trans.* N.S. xxxvi, p. 142, but is shorter being  $3\frac{3}{4}$  inches long while the other was  $4\frac{1}{2}$  inches.

It is ornamented with 3 vertical ribs on each side. Fig. 4 and 4a.
