

FWP24

THE VILLAGES

The study area contains three extant villages. Their present names are West Overton, Lockeridge and Fyfield but they were previously called respectively (East?) Overton, *Ovretone (DB)* and, earlier still, *Uferan tune* (AD 939, BCS 734); *Locherige (DB)* or *Lokeruga* (1142); and *Fifhide (DB)*. All three lie in the valley of the R.Kennet, just above the flood plain; two are on the south bank but Fyfield is on the northern side. This distinction is conceivably significant.

At least three other villages, or at least nucleated settlements, formerly existed. In one case, Shaw in West Overton parish, the site is totally deserted (ref. D.J.Bonney's paper in WAM, 1970s?). The Anglo-Saxon West Overton, attested by two 10th century charters (*below* p.00), is insecurely located, though three different sites can be proposed for it. And a possible separate settlement of Dene perhaps existed at the south end of the present Lockeridge.

Far to the N of Lockeridge, relevant to our concerns but actually just outside the parish of Fyfield, is another village, now almost totally deserted. It lies on the top of the Downs and the surviving farm there has almost certainly been called 'Wick' since at least the later C16 ('*montem vocatum Wyke*' in *Pemb Surv* 1570). The site was, however, almost certainly that of a preceptory of the Knight Templars known to have been at Rockley since the mid-C12 (*below* p.00).

The following notes are based on fieldwork in the three extant villages. The various shapes and extents of the settlements were investigated, for a changing morphology was both assumed to have existed, to be discoverable, and to be of historical significance. Every single house present on OS maps up to c1950 and the great majority of other buildings were visually inspected externally with a view to forming judgements about settlement morphology, chronology, local economics and, up to a point, sociology. Gardens were inspected and hedges peered through, looking for earthworks and other traces of former settlement. Some metrical survey was undertaken, principally in West Overton; other records were made on the OS 25 inch map or by sketch plans. Photographs were taken, fortunately because much of what was there around 1960 has since been destroyed. Residents, who were as curious as we were, were talked to, introducing us to the liveliness of local folklore - some of it very recent, - and to handfuls of finds from vegetable plot and new garage access. We suspect, however, that our access to such information has been minimal, not through ill-will but because of the lack of trained observation of the phenomenal amount of ground disturbance which has taken place over the three and a half decades since the project began.

Comment:

West Overton

The village is superficially a street village oriented W-E along the S side of the River Kennet's flood plain. The village's main road, here called the 'Street' (but what is it actually called?) leads up to the church on a slight, but locally prominent, eminence at its E end. About half-way along the street, a geometrically awkward cross-roads gives off what were in the 1960s minor lanes to N and S, though that to the S is now the priority road at the junction. Behind such mundane detail lies a village which in the morphology of its plan quite as much as in its visible archaeology of earthworks and buildings is historically quite complicated and probably the most interesting of the three villages in view.

The awkwardness of the cross-roads, for example, immediately raises the suspicion that the W part of the present village street may be a 'late' re-alignment, perhaps to lead to the model farm at its W end. A glance at the current OS map as well as on the ground indeed suggests that the, or an, 'old' road may have led straight on westwards from the cross-roads along what has since become merely the back-lane behind the houses on the front street. The west end of that street is closed by West Overton Farm. Almost the whole of the C19 century model farmyard has been destroyed since our project began but the farmhouse of c1800 still stands rather grandly looking out over the River towards the Bell Inn. So much for a superficial appraisal, though it turns out to be not too far from the history realised by a more considered examination.

To begin at the extreme W end of the village with West Overton Farm house: with its slate roof, Flemish brickwork, two storeys and double pile plan, it is one of the several Georgian 'country seat-type' houses scattered occasionally in our study area, indicative of a certain prosperity and a stating of social status during the Napoleonic period. The means, indeed social need, to do such was presumably being provided by the emergent 'winners' in the increasingly formalised rural hierarchy resulting from Enclosure. Listed Grade II, it is dated 'Late C18-early C19' but in fact we can be more precise. It is not present on the 1816 Enclosure Award map but is shown on the 1st ed. of the OS 25 inch map (1811) (but we must check whether it is on the Tithe Map; haven't I done a tracing thereof? If not, where is the original? in Diocesan Record Office? - and this applies to all the villages and other matters).

Equally evocative in its position and architecture was the visually somewhat different corrugated-iron Wesleyan Methodist Chapel. This lay nearby, - and what offence that may well have caused, - formerly situated immediately S of the Farm and, significantly, right on the dog-leg of the road forced to turn S by the farmyard before going out into the open fields. Presumably the Chapel marked the very end of the village around 1840 where the back lane and main street joined. It was removed in the early 1960s (Pl. ££) and replaced by a bungalow, in its turn saying a lot about the later C20 in its positioning and remarkably undistinguished architecture (Pl. £1).

Farmhouse and Chapel have 'fixed' the W end of the village for a century and a half. The roads to and past them have been in existence longer, and indeed belong to a 'street pattern' in existence in 1802 and, presumably, earlier (map of West Overton Manor). The western, straight part of the village street existed then and so is not a C19 addition as surmised above; but it was merely the W-E part of a plan which also included a N-S road of which the northern half has since totally disappeared. It curved SW from the ford to form a T-junction with the W-E street and then ran straight on southwards along a line now represented by a path only (CHECK). It intersected the 'back-lane' running E from the present cross-roads in the village centre which, at the time about 200 years ago, was probably not a cross-roads and certainly not **the** village of West Overton that we know. That did not exist. West Overton lay, a little rectangle of properties 150 m. W-E by 75 m. N-S, 100 m. across an unoccupied area W of today's cross roads. It was aligned along two W-E roads, each end closed by N-S roads running respectively from a bridge and a ford southwards to the fields.

Modern development has indeed replaced much that existed 35 years ago, though its control through Town and Country Planning has re-enforced the village morphology, even where new housing has filled in what were spaces. The S side of the W end of the village street has been replaced by such development; and the lane running S from the apparently minor cross-roads in the village centre has now become the major road, leading to what used to be the space occupied by South Farm. Now it is occupied by a development looking very much like TV's 'Brookside.' A splendid range of timber buildings enclosing a farmyard opposite South Farm was already seriously delapidated in 1960 (Pl. **) and has since been destroyed. That this former lane might possibly be of some antiquity is hinted at by the fact that it continues northwards from the cross-roads, passing two houses of C19 or earlier date aligned along this now little used and apparent *cul de sac*. It in fact leads down to the river, with a track leading away to the N on the other side. The inference is obvious. And a ford hereabouts is likely to be an old one, older probably than the usable ford 100 m downstream (which appears related to the water-meadows (*below* p. 00)). This northern lane of West Overton's village plan is in fact on the line of the boundary as defined in the C10 century by two Charters, respectively of West and **East** Overton (*below* Chap. 9).

To the E, the village street rises as it approaches the Church. Clearly we are entering the 'old' part of the village, in as far as this is indicated by standing houses. On the N side of the road is a group of C19 buildings with older origins; then there is the Vicarage or Rectory, now West Overton House. It looks the part for an upwardly mobile (or struggling to keep up?) cleric of the late C18: of sarsen and faced with rendered brickwork, its three bays and two storeys plus attics rival West Farmhouse. Then, in contrast, is a range of low, thatched cottages, acutely perched on a sharp corner as the road dives down to the N. In fact, it is a hollow-way still in use, it being as much a 3 m. deep below ground level as it then curves around to the NE. The cottages are C17/18, of sarsen with brick dressings, windows now replacing their end doors. Across the top of the

hollow-way and again up-slope is 'The Old Manor House', visibly one of the oldest houses in the village. Of C16 date with many later additions and alterations it is basically of sarsen build with a timber-framed and tile-hung upper floor and, south centre, a canopied porch (?C18, though Pevsner, 1963, 505, dates the door C16). The impression of oldness is maintained by the two remaining secular buildings at this E end of the village. To the N, tucked into the slope downhill of the Church, is Church Hill cottage, C17 or earlier with colourwashed brick and thatch, remains of a probable cruck and a sarsen rear wall. Immediately E of the Church are nos. 74/75 Church Hill, two cottages but actually a former cottage, probably C17 at latest, to which the Verger's Cottage was added in 1746 (datestone). Both are thatched and seemingly crowd into the churchyard, adding their contribution to the antique effect at this E end of the village.

Most people do not, however, observe the really old remains. Naturally they look at the Church of St. Michael and All Angels, for it dominates the village and, because of its impressive tower, is a prominent landmark both along the Kennet valley and looking S from Overton Down. And undoubtedly its site is ancient, though not the present building (Pevsner 1963, 504-5; Anon, *Church of St Michael*, undated). The tower is indeed of 1883, an addition to an almost complete rebuild of 1877-8 to the design of C.E. Ponting. This was occasioned by the dire state of the then standing church, apparently a C14 chancel with a C15 nave. Though the Victorian nave followed the plan of that church, most of the building shown before rebuilding on fig. 00 was removed. Parts, however, remain: the chancel arch, for example, was moved to its present position in the side aisle next the organ chamber. During the work, fragments of an earlier church still were found, and two early consecration crosses that were unearthed were built into the external E chancel wall where they can still be seen (Pl. **). Pevsner noted a decorated Norman window head in the porch. The present somewhat dramatic church is, therefore, the third known church on the site, taking stone construction certainly back to the C13 and possibly earlier (Norman?). It is legitimate to surmise that, with East Overton a manor of Winchester from before Domesday (*below* p. 00), an Anglo-Saxon church, in stone or otherwise, is highly likely at least by the C10. It is a guess, but plausibly so, that all this occurred here because the locally prominent spot was first chosen for Christian worship in earlier times, perhaps in the C7 (*below* p. 00).

Such hypothetical earlier churches, unlike Ponting's eye-catcher, are invisible; but right beside the Church, stretching away to its SW, is a grass field-full of earthworks (fig. 00). They represent a totally deserted part of East Overton and, it has to be said, with the Church the most important part of the historical village. The humps, bumps and hollows may look insignificant and meaningless but at least within them lies a pattern. Decipherable are the hollow-ways of former roads or tracks, the sites of former buildings, the banks around closes or gardens. Some deeper, larger hollows and other superficial features almost certainly represent disturbance after desertion, probably quarrying and robber pits for the

sarsen stones of former walls and foundations. But a further pattern appears to be present: a distinction between the earthworks to E and W respectively of the N-S hollow-way which runs into the field to continue southwards the hollow-way already noted as climbing up from the river into the village. East of it is another hollow-way coming in from the existing road from the E. In the area between those two hollow-ways and the Church, the earthworks are slight and mainly of a cluster of ten or so apparent building sites, bounded on the E by a low bank. To the S, across the E-W hollow-way, is a `blank` area. In contrast, W of the main N-S hollow-way, the earthworks are more upstanding, more rectilinear and apparently enclose somewhat larger spaces. Their almost planned appearance is emphasised by the presence on their S side of 25 m. of non-symmetrical hollow-way. The earthworks themselves, including perhaps six sites of potential buildings, relate to another E-W hollow-way, debouching into the area of the now-destroyed barns of South Farm, and, 60 m. N, a parallel bank. Neither that bank nor its parallel hollow-way, the axes as it were of the western part of this earthwork complex, continue to the E into the area S of the Church; but both are parallel to the eastern end of the present village street now leading up to the Church (see *above* p. 00).

The significance of this settlement complex is not yet fully apparent.; but it must be said immediately that it comprises an extremely good set of well-preserved earthworks of medieval settlement. Furthermore, for Wiltshire they represent a rare example of an an apparently `complete` deserted medieval settlement existing, not out in isolation on the downs or along a river valley, but actually in a village. We do not know, however, whether they represent the whole medieval village which then, for reasons unknown at present, shuffled sideways and northwards to its present alignment along the street; or whether they represent just part of a village which became partly deserted, that is, which shrank as distinct from moved. On the other hand, the earthworks may be the remains of a late addition to an existing village, an expansion perhaps in the C12-13 when population growth burst out of its essentially Anglo-Saxon village shape and size. So far, no documentary evidence has come to light bearing on this desertion, whether it be the result of shuffle, shrinkage or expansion.

Our own interpretation involves a more complex model, potentially taking the village story back to its beginnings as a village (in the absence of any pre-Anglo-Saxon evidence from the site). We suggest that the hollow-way coming off the flood-plain round the NW side of the `ancient` church site continued southwards as the N-S hollow-way dividing the earthwork remains as distinguished above. Presumably it then climbed southwards to the local resources of arable land and woodland beyond; while a branch to the east could have taken inter-village traffic. These N-S and W-E tracks, we suggest, bounded at least the S part of an early settlement, perhaps a nucleated village, centred on the Church; potentially this is the site of the Anglo-Saxon settlement.

We then suggest that the rest of the earthworks, W of that N-S hollow-way, should be seen in conjunction with the eastern part of the present village street as forming a characteristic rectilinear planned village. One would expect such to be of C12-13, though no specific evidence for such an event has so far emerged. Planned or otherwise, the point seems to be that the village expands in a reasonably logical manner to the W of its nucleus as far as - but no further than, - the manor's western boundary, still basically where it had been in the C10 i.e. along the N-S lane running through the middle of present-day Overton.

We envisage therefore a village some 200 m. square, that is 200 m from the 'old' N-S hollow-way on the E to the probably equally 'old' N-S lane along the Anglo-Saxon estate boundary to the W; and about 200 m. from the back of the properties along the N side of the northern street to a similar position at the back of the properties on the S side of the southern street. This rectangular plan is divided exactly in half, at 100 m. from both property boundaries as envisaged, by the W-E bank running through the centre of the earthworks. At some later date, the southern half, and eventually the southern strip of the northern half, of this rectangular village was deserted or possibly even cleared, leaving the big houses on the N side of the approach to the Church with a clear view southwards across a green and pleasant field. Is there by any chance cartographic evidence to show buildings in the 'earthworks field, disappearing during precisely the period either side of 1800 when the existing houses were being Georgianised and new gentry houses being built?

Lockeridge

The present village stands back from the south bank of the R. Kennet, stretching along a N-S street lying between the edge of the flood plain and the NE end of Lockeridge Dene. It lies on basically flat land on the NE side of the relatively high ridge of White Hill and immediately W of a nameless lower ridge. Indeed, in its local context of low and undramatic relief Lockeridge nevertheless is fairly precisely positioned in the gap between two ridges, a fact which may be reflected in its name, its precise position and even perhaps its primary function.

From near the centre of the street village, one road leads W towards Overton and at the S end another climbs SE up a holloway past Sarsen Land towards West Woods. While that may have been the main internal route for local purposes N-S within the very narrow tithing of Lockeridge, another road bends

away to the SW from the S end of the street, going along Lockeridge Dene and, after a few miles, providing access to the Vale of Pewsey. That access may conceivably provide a clue to the village's origins and function for, moving N from Lockeridge Dene, that road becomes the village street. At its N end, this leads to a crossing of the R. Kennet and on through to Fyfield and the main E-W route now represented by the A4 but earlier marked by the Roman road cross the flood plain between Lockeridge and Fyfield. In other words, Lockeridge may be where it is because, in some sense, it 'commands' a locally important N-S through route at a river crossing and at a 'pinch point' between high ground. Historically, the village is listed in DB and is generally accepted as the Lockeridge of the Knights Templars in the 13th century (*below* p. 00).

Morphologically, the settlement can arguably be divided into two now-merged settlements. One called Dene could well have been the earlier and perhaps the original Lockeridge. This lay across the end of Lockeridge Dene, now represented by eight houses scattered in rectilinear fashion around the still stone-filled dene floor (long a National Trust property for the interest of its sarsens). It also contains a pond and ends to its E with the suggestion of a triangular village green defined by the parting of the roads. Six of the houses appear to be of 18/19th century date, but two might be pre-1700. One is the small wayside cottage at the extreme SW corner of Dene; the other is the long building with an external oven lying endways on to the road at the NE of the settlement. All appear to relate to this place called Dene, its topography and morphology, and to be quite distinct from the village of Lockeridge.

The distinction is now largely masked by infilling of the space between the last houses at the N end of Dene and the S end of Lockeridge. Work in front of one new house exposed several dozen 12/13th century sherds (P on fig. 00), indicating that this 'gap' probably did not exist in medieval times. On the E of the road opposite 'P' the current paddock contains earthworks suggesting houses and gardens formerly existed there too. A rather different sort of archaeology is recorded behind the School (1874) a little further N along the village street: 'prehistoric flint dagger, skeleton and pottery found', presumably when some gravel pits were being worked (OS give earliest ref. and also orig. ref. which can be got from VCH I.i). Otherwise, the village contains remarkably little in the way of old structures, appearing to be mainly a 19th century creation. The five potentially pre-1700 houses, all E of the street, are shown on fig. 00

(the following is a rough first draft of part of Chap. 3 [to be dropped in to the 'Bottomlands' section] but it could go into a new Chap 2 if all the Intro. stuff, inc. methodology, went into 1. The guts of the c5k words here can easily be reduced to c2k for a realistic 2nd , potentially publishable 2nd draft - pjf 20/21. vi. 95)

THE VILLAGES

Introduction

The study area contains three extant villages. Their present names are West Overton, Lockeridge and Fyfield but they were previously called respectively (East?) Overton, *Ovretone (DB)* and, earlier still, *Uferan tune* (AD 939, BCS 734); *Locherige (DB)* or *Lokeruga* (1142); and *Fifhide (DB)*. All three lie in the valley of the R.Kennet, just above the flood plain; two are on the south bank but Fyfield is on the northern side. This distinction is conceivably significant.

At least three other villages, or at least nucleated settlements, formerly existed. In one case, Shaw, a separate tithing but now in the extreme SW of West Overton parish, the site was totally deserted in the early C15 (Hare 1994, 167; + ref. D.J.Bonney's paper in WAM, 1970s?; and *below* p. 00). The Anglo-Saxon West Overton, attested by two 10th century charters (*below* p.00), is insecurely located, though three different sites can be proposed for it (*below* p. 00). And a possible separate settlement of Dene perhaps existed at the south end of the present Lockeridge (*below* p. 00).

Five and a half kms. N of Lockeridge, relevant to our concerns but actually just outside the parish of Fyfield, is another village, now almost totally deserted. It lies on the top of the Downs and the surviving farm there has almost certainly been called 'Wick' since at least the later C16 ('*montem vocatum Wyke*' in *Pemb Surv* 1570). The site was, however, almost certainly that of a preceptory of the Knight Templars known to have been at Rockley since the mid-C12 and still named 'Old Chapel' on Temple Downs in 1723 (*below* p.00).

The following notes are based on fieldwork in the three extant villages. The various shapes and extents of the settlements were investigated, for a changing morphology was both assumed to have existed, to be discoverable, and to be of historical significance. Every single house present on OS maps up to c1950 and the great majority of other buildings were visually inspected externally with a view to forming judgements about settlement morphology, chronology, local economics and, up to a point, sociology. Gardens were inspected and hedges peered through, looking for earthworks and other traces of former settlement. Some metrical survey was undertaken, principally in West Overton; other records were made on the OS 25 inch map or by sketch plans. Photographs were taken, fortunately because much of what was there around 1960 has since been destroyed. Residents, who were as curious as we were, were talked to, introducing us to the liveliness of local folklore - some of it very recent, - and to handfuls of finds from vegetable plot and new garage access. We suspect, however, that our access to such information has been minimal, not through ill-will but because of the lack of trained observation of the widespread ground disturbance which has taken place over the three and a half decades since the project began.

Comment: Page: 2

West Overton

The village is superficially a street village oriented W-E along the S side of the flood plain of the River Kennet. The village's main road apparently has no specific name but is here called the 'Street' purely for identification purposes. It leads up to the church on a slight, but locally prominent, eminence at its E end. About half-way along the street, a geometrically awkward cross-roads gives off what were in the 1960s minor lanes to N (Frog Lane) and S, though that to the S is now the priority road at the junction because of the traffic to a recent housing estate towards its southern end. Behind such mundane detail lies a village which in the morphology of its plan quite as much as in its visible archaeology of earthworks and buildings is historically quite complicated and probably the most interesting of the three villages in view.

The awkwardness of the cross-roads, for example, immediately raises the suspicion that the W part of the present village street may be a 'late' re-alignment, perhaps to lead to the model farm at its W end. A glance at the current OS map as well as on the ground indeed suggests that the, or an, 'old' road may have led straight on westwards from the cross-roads along what has since become merely the back-lane behind the houses on the front street. The west end of that street is closed by West Overton Farm. Almost the whole of the C19 century model farmyard has been destroyed since our project began but the farmhouse apparently of c1800 still stands rather grandly looking out northwards over the River towards the Bell Inn. So much for a superficial appraisal, though it turns out to be not too far from the history realised by a more considered examination.

To begin at the extreme W end of the village with West Overton Farm house: with its slate roof, Flemish brickwork, two storeys and double pile plan, it is one of the several Georgian 'country seat-type' houses scattered occasionally in our study area, indicative of a certain prosperity and a stating of social status during the Napoleonic period. The means, indeed social need, to do such was presumably being provided by the emergent 'winners' in the increasingly formalised rural hierarchy resulting from Enclosure, the point being reinforced in a sense by the fact that this farmhouse is not shown on the Enclosure Award map (1816). Listed Grade II, it is dated 'Late C18-early C19' but in fact we can be more precise precisely because it was not there in 1816. We still have to check whether it is on the Tithe Map of ?1840 (I would guess it is) but it is shown on the 1st ed. of the OS 25 inch map (1885?).

Equally evocative in its position and architecture was the visually somewhat different corrugated-iron Wesleyan Methodist Chapel. This lay nearby, - and what offence that may well have caused, - formerly situated immediately S of the Farm and, significantly, right on the dog-leg of the road forced to turn S by the farmyard before going out into the 'old arable' of the unenclosed fields (get the names off the Enclos. Map - South Field??). Presumably the Chapel marked the very end of the village around 1840 where the back lane and main street

joined. It was removed in the early 1960s (Pl. ££) and replaced by a bungalow, in its turn saying a lot about the later C20 in its positioning and remarkably undistinguished architecture (Pl. £1).

Farmhouse and Chapel have 'fixed' the W end of the village for a century and a half. The roads to and past them have been in existence longer, and indeed belong to a 'street pattern' in existence in 1802 and, presumably, earlier (map of West Overton Manor). The western, straight part of the village street existed then and so is not a C19 addition as surmised above; but it was merely the W-E part of a plan which also included a N-S road of which the northern half has since totally disappeared. That N half curved SW from the ford to form a T-junction with the W-E street and then run straight on southwards along a line now represented by a path only (CHECK). This N-S road indeed formed the E end of the village, with one 'old' house out along it on the way to the (name off Manorial map?) fields (fig. 00). This boundary road intersected the 'back-lane' running E from the present cross-roads in the village centre which, at the time about 200 years ago, was probably not a cross-roads and certainly not the centre of **the** village of West Overton as we now see it. That did not exist. West Overton lay, a little rectangle of properties 150 m. W-E by 75 m. N-S, 100 m. across an unoccupied area W of today's cross roads. It was aligned along two W-E roads, each end closed by N-S roads running respectively from a bridge and a ford southwards to the fields. Indeed, this rectilinear shape lying as an independent entity with clear ground all around suggests an origin in an act of village planning.

That it was all there by c.1800 indicates that such planning, or even the planting of a whole village was nothing to do with model farms and improved housing for farm labourers during the age of agricultural 'revolution.' Yet there are no 'old' *sensu* pre-1700 houses in it. The only house likely to be of that date or earlier in the W part of the present village is on the N side of the planned unit being proposed and is probably best seen as sited in relation to the former road curving round from the ford as shown on the manorial map of 1802 (fig. 00). Nevertheless, if the rectilinear plan really does hint at a deliberate planting or a planned village, then such an origin is most likely to be medieval. The site clearly lies within what was an Anglo-Saxon estate in the 10th century and it could have originated in late Saxon times, perhaps to pull a dispersed community together, perhaps to move the community (from what is now East Kennet??) nearer to the one church in the immediate area i.e. St Michaels in the late Saxon East Overton (see *below* p. 00). But it could have easily been founded somewhat later, perhaps at the same time as, - and in response to? - the 'new village' of East Overton (if indeed that itself is not late Saxon). Another occasion might have been in the mid-C12 when the Templars moved into the neighbouring Lockeridge and possibly themselves created a newly ordered settlement (*below* p. 00). West Overton first appears as *Westovertone* in 1275 (*PNW* 305), implying a need to distinguish a West one from the East one by at least the later C13. Or the Abbess of Wilton, who owned the estate, might have simply re-arranged her

affairs for purely local or personal reasons at any time between her (pre-Norman but undated) acquisition and the Dissolution.

Having ourselves distinguished the two Overton villages, and physically isolated the western one, we can now turn to the East one and the eastern end of the present village. The village was part of a manor belonging to the Priory of St. Swithin's, Winchester. Modern development has replaced much of the village that existed 35 years ago, though its control through Town and Country Planning has tended to re-inforce some elements of the older village morphology, even where new housing has filled in what were spaces. Such development has respected the line of a new straight length of road inserted in the mid-C19 to link the two 'old' cross roads and replace completely the curving road from the ford. That line of that 'old' road was simply disregarded by the new housing that grew up in the mid-C19 along the N side of the new link road. Over a century later, however, new housing which infilled the open space between the 'planned' part of West Overton to the W and the cross-roads to the E reflected the historical triangular shape, perhaps originally a green, formed by the new C19 road on the N and the old road to the S (fig. 00).

Another more recent estate looking very much like TV's 'Brookside' has both re-inforced the position of the now-destroyed South Farm and strengthened the line of the lane running S from the apparently minor, but actually Anglo-Saxon, cross-roads in the village centre to it. South Farm itself was on a site of some antiquity, for the tithing and Anglo-Saxon charter estate boundary both bent W from that cross-roads to embrace it. A splendid range of timber buildings enclosing a farmyard opposite South Farm was already seriously delapidated in 1960 (Pl. **) and has also since been destroyed. That the former lane between them might possibly also be of some antiquity is hinted at by the fact that, as well as running out into the fields to the S, to the N it continues beyond the cross-roads as an apparent *cul de sac*, Frog Lane, going to two houses of C19 or earlier date aligned along it. In fact it leads down to the river, with a track leading away to the N on the other side. The inference is obvious. And a ford hereabouts is likely to be an old one, older probably than the usable ford 100 m downstream (which appears related to the water-meadows (*below* p. 00).

Frog Lane is in fact an integral part of West Overton's village plan for it is in fact on the line of the boundary as defined in the C10 century by two Charters, respectively of West and **East** Overton (*below* Chap. 9).

To the E, the village street rises as it approaches the Church. Clearly we are entering the 'old' part of the village, in as far as this is indicated by standing houses. On the N side of the road is a group of C19 buildings with older origins; then there is the Vicarage or Rectory, now West Overton House. It looks the part for an upwardly mobile (or struggling to keep up?) cleric of the late C18: of sarsen and faced with rendered brickwork, its three bays and two storeys plus attics rival West Farmhouse. Then, in contrast, is a range of low, thatched cottages, acutely perched on a sharp corner as the road dives down to the N. In

fact, it is a hollow-way still in use, it being as much as 3 m. deep below ground level as it then curves around to the NE. The cottages are C17/18, of sarsen with brick dressings, windows now replacing their end doors.

Across the top of the hollow-way and again up-slope is 'The Old Manor House', visibly one of the oldest houses in the village. Of C16 date with many later additions and alterations it is basically of sarsen build with a timber-framed and tile-hung upper floor and, south centre, a canopied porch (?C18, though Pevsner, 1963, 505, dates the door C16). The impression of oldness is maintained by the two remaining secular buildings at this E end of the village. To the N, tucked into the slope downhill of the Church, is Church Hill cottage, C17 or earlier with colourwashed brick and thatch, remains of a probable cruck and a sarsen rear wall. Immediately E of the Church are nos. 74/75 Church Hill, two cottages but actually a former cottage, probably C17 at latest, to which the Verger's Cottage was added in 1746 (datestone). Both are thatched and seemingly crowd into the churchyard, adding their contribution to the antique effect at this E end of the village. On the other side, their E, they seem to be roadside cottages, for the road they front was there in 1815.

The Church of St. Michael and All Angels dominates the village and, because of its impressive tower, is a prominent landmark both along the Kennet valley and looking S from Overton Down. And undoubtedly its site is ancient, though not the present building (Pevsner 1963, 504-5; Anon, *Church of St Michael*, undated). The tower is indeed of 1883, an addition to an almost complete rebuild of 1877-8 to the design of C.E.Ponting. This was occasioned by the dire state of the then standing church, apparently a C14 chancel with a C15 nave. Though the Victorian nave followed the plan of that church, most of the building shown before rebuilding on fig. 00 was removed. Parts, however, remain: the chancel arch, for example, was moved to its present position in the side aisle next the organ chamber. During the work, fragments of an earlier church still were found, and two early consecration crosses that were unearthed were built into the external E chancel wall where they can still be seen (Pl. **). Pevsner noted a decorated Norman window head in the porch (CHECK whether it's there: my memory is that it is, tho' I was doubtful of its authenticity). The present somewhat dramatic church is, therefore, the third known church on the site, taking stone construction certainly back to the C13 and possibly earlier (Norman?).

It is legitimate to surmise that, with East Overton a manor of Winchester from before Domesday (*below* p. 00), an Anglo-Saxon church, in stone or otherwise, is highly likely at least by the C10. It is a guess, but plausibly so, that all this occurred at East Overton because the locally prominent spot was first chosen for Christian worship in earlier times, perhaps in the C7 (*below* p. 00). Something similar may have happened at Avebury, albeit for different reasons perhaps. There, unlike Overton, the shape and some of the fabric of the Anglo-Saxon church survives.

Such hypothetical earlier churches, unlike Ponting's eye-catcher, are invisible; but right beside the Church, stretching away to its SW, is a grass field-full of earthworks (fig. 00). They represent a totally deserted part of East Overton and with the Church form the most important part of the historical village. The humps, bumps and hollows may look insignificant and meaningless but at least within them lies a pattern. Decipherable are the hollow-ways of former roads or tracks, the sites of former buildings, the banks around closes or gardens. Some deeper, larger hollows and other superficial features almost certainly represent disturbance after desertion, probably quarrying and robber pits for the sarsen stones of former walls and foundations.

But a further and historically more significant pattern appears to be present: a distinction between the earthworks to E and W respectively of the N-S hollow-way which runs into the field to continue southwards the hollow-way already noted as climbing up from the river into the village. East of it is another hollow-way coming in from the existing road from the E. In the area between those two hollow-ways and the Church, the earthworks are slight and mainly of a cluster of ten or so apparent building sites, bounded on the E by a low bank. To the S, across the E-W hollow-way, is a 'blank' area. The inference is that the E-W hollow-way formed the southern boundary of this part of the settlement.

In contrast, W of the main N-S hollow-way, the earthworks are more upstanding, more rectilinear and apparently enclose somewhat larger spaces. Their almost planned appearance is emphasised by the presence on their S side of 25 m. of non-symmetrical hollow-way, almost certainly a relic from an earlier phase. The earthworks themselves, including perhaps six sites of potential buildings, relate to another E-W hollow-way, debouching into the area of the now-destroyed barns of South Farm. They also relate to, 60 m. N, a parallel bank. Neither that bank nor its parallel hollow-way, the axes as it were of the western part of this earthwork complex, continue to the E into the area S of the Church; but both are parallel to the eastern end of the present village street now leading up to the Church (see *above* p. 00).

The significance of this complex of settlement earthworks is not yet fully apparent; but it certainly comprises an extremely good set of well-preserved earthworks of what would be called, if they existed in isolation, a 'deserted medieval village' (paradoxically, if interpreted within a 'settlement shuffle' model, that may be precisely what they are). Indeed, for Wiltshire they represent a particularly good example of an apparently 'complete DMV' existing, not out in isolation on the downs or alone along a river valley, but actually in a village. At this interim stage, however, we do not know whether they represent a whole medieval village which then, for reasons unknown at present, shuffled sideways and northwards to its present alignment along the street; or whether they represent just part of a village which became partly deserted, that is, which shrank as distinct from moving sideways. On the other hand, the earthworks may be the remains of a late addition to an existing village, an expansion perhaps in

the C12-13 when population growth burst out of its essentially Anglo-Saxon village shape and size. So far, no documentary evidence has come to light bearing on this desertion, whether it be the result of shuffle, shrinkage or expansion.

Our own interpretation involves a more complex model, potentially taking the village story back to its beginnings as a village (in the absence of any pre-Anglo-Saxon evidence from the site *cf.* *Fyfield below* p. 00). We suggest that the hollow-way coming off the flood-plain round the NW side of the 'ancient' church site continued southwards as the N-S hollow-way dividing the earthwork remains as distinguished above (fig. 00). Presumably it then climbed southwards to the local resources of arable land (later documented as 'Long Field' and 'White Barrow Field', undated but late C18 manorial map), pasture and woodland beyond ('Tenants Down' and 'Wolfs Grove Coppice' late C18), possibly going as far as Wansdyke. Its E branch S of the Church led SE to Lockeridge. These N-S and W-E tracks, we suggest, bounded at least the S part of an early settlement, perhaps a nucleated village, centred on the Church. Potentially this little knoll and its slight slopes above the flood plain is the site of the Anglo-Saxon settlement, and probably of the earliest occupation of this area what ever the date.

The rest of the earthworks, W of that N-S hollow-way, can be interpreted in conjunction with the eastern part of the present village street as forming a characteristic rectilinear planned village added to an existing nucleated one (as well-demonstrated in south Somerset over 20 years ago, Ellison 1973; Lewis' 1994, 188-89, recent discussion of medieval planned settlements in Wiltshire does not assemble similar evidence). Such a development might generally be best envisaged as of C12-13, though no specific evidence for such an event has so far emerged in this case. The earliest reference to Overton *Abbatisse* is 1316, which may be due to the chance of documentary survival but is at least telling us that by the early C14 it was necessary to distinguish it from the *West* Overton. Planned or otherwise, the point seems to be that the village expands in a reasonably logical manner to the W of its nucleus as far as - but no further than, - South Farm and the manor's western boundary. The latter - and perhaps also the Farm? - was still basically where it had been in the C10 i.e. along Frog Lane leading from the ford to the cross-roads in the middle of present-day Overton and then bending westwards around South Farm.

We envisage therefore a village some 200 m. square, that is 200 m from the 'old' N-S hollow-way on the E to the probably equally 'old' N-S lane along the E side of (or through?) South Farm to the W; and about 200 m. from the back of the properties along the N side of the northern street to a similar position at the back of the properties on the S side of the southern street (the present road along the south side of the earthworks). This rectangular plan is divided exactly in half, at 100 m. from both property boundaries as envisaged *above*, by the W-E bank running through the centre of the earthworks.

At some later date, the southern half, and eventually the southern strip of the northern half, of this rectangular village was deserted or possibly even cleared. Six buildings appear to be depicted in these fields on the late C18 manorial map; their positions re-inforce the `early` pattern of the N-S hollow-way and the settlement core to its E. Only one building is shown in the area of the `planned` earthworks and that had disappeared some 25 years later. Then, only one building, perhaps a shed or barn set up in the hollow-way, is shown in the two fields on the Enclosure Award Map (1815). Only some hachures mark its site on C19 OS maps. The houses on the N side of the approach to the Church have then enjoyed an effectively clear view southwards across a green and pleasant field for at least 200 years.

Whether we are looking at the earthworks of abandonment, slow desertion, `village shuffle` or manorial clearance, a fairly safe inference is that the change from habitation to grass took place long before 1800. A guess would place it in the C14-15. They may be irrelevant to consideration of a valley-bottom village because of their marginal location and special status, but two local downland settlements, Raddun (*below* p. 00) and Shaw (*below* p. 00) were deserted around 1300 and 1400 respectively. More generally, following Hare (1994, 167-8) and trends of demographic and economic decline balanced by local stability (Lewis 1994, 177-83), recent discussion points, albeit for different reasons, to the same period; but the best evidence, short of excavation, is most likely to come from an as yet unnoted documentary source. On such a long-established ecclesiastical estate as East Overton, where other records indicate a sensitivity to annual returns and rents, did not anyone notice that the medieval village, or at least a large part of it, was not there any more?

Lockeridge

The present village stands back from the south bank of the R. Kennet, stretching along a N-S street lying between the edge of the flood plain and the NE end of Lockeridge Dene. It lies on basically flat land on the NE side of the relatively high ridge of White Hill and immediately W of a nameless lower ridge. Indeed, in its local context of low and undramatic relief Lockeridge nevertheless is fairly precisely positioned N and S of the gap between two ridges, a fact which may be reflected in its name, its precise position and even perhaps its primary function. PNW (p. 306) suggests the PN might originate *sensu* `ridge marked by enclosures.`

From near the centre of the street village, one road leads W towards Overton and at the S end another climbs SE up a holloway past `Sarsen Land` towards West Woods. While that may have been the main internal route for local purposes N-S within the very narrow tithing of Lockeridge, another road bends away to the SW from the S end of the street, going along Lockeridge Dene and, after a few miles, providing access to the Vale of Pewsey. That access may

conceivably provide a clue to the village's origins and function for, moving N from Lockeridge Dene, that road becomes the village street. At its N end, this leads to a crossing of the R. Kennet and on through to Fyfield and the main E-W route now represented by the A4 but earlier marked by the Roman road cross the flood plain between Lockeridge and Fyfield. In other words, Lockeridge may be where it is because, in some sense, it 'commands' a locally important N-S through route at a river crossing and at a 'pinch point' between high ground.

Historically, the village is listed in DB and is generally accepted as the Lockeridge of the Knights Templars in the 13th century (*below* p. 00).

Morphologically, the settlement can arguably be divided into two now-merged settlements. One called Dene, though not recognised as a separate place or PN by PNW, could well have been the earlier and perhaps the original Lockeridge. This lay across the E end of Lockeridge Dene, now represented by eight houses scattered in rectilinear fashion around the still stone-filled dene floor (long a National Trust property for the interest of its sarsens). The settlement also contains a pond and ends to its E with the suggestion of a triangular village green, an open space defined by the parting of the roads. Six of the houses appear to be of 18/19th century date, but two at least contain structural elements of earlier than 1700. One is the small wayside cottage at the extreme SW corner of Dene; the other is the long building with an external oven lying endways on to the road at the NE of the settlement. All appear to relate to this place called Dene, its topography and morphology, and to be quite distinct from the village of Lockeridge.

The distinction is now largely masked by infilling of the space between the last houses at the N end of Dene and the S end of Lockeridge. Work in front of one new house exposed several dozen 12/13th century sherds (P on fig. 00), indicating that this 'gap' probably did not exist in medieval times. On the E of the road opposite 'P', the current paddock contains earthworks suggesting houses and gardens formerly existed there too. A rather different sort of archaeology is recorded behind the School (1874) a little further N along the village street: 'prehistoric flint dagger, skeleton and pottery found', presumably when some gravel pits were being worked (OS give earliest ref. and also orig. ref. which can be got from VCH I.i; check with SMR too). A long barrow is also recorded close by (*above* p. 00). Otherwise, the village contains remarkably little in the way of old structures, appearing to be mainly a 19th century creation. The five potentially pre-1700 houses, all E of the street, are shown on fig. 00

Fyfield

Fyfield is now, in 1995, a very differently shaped village from at least two other forms it has enjoyed in the past. It has been developed almost beyond recognition since 1960, mainly by an undistinguished little estate W of the church, and now is made up of a fragmentary clutter of buildings clustered round

the Church, partly strung along along the A4 which dominates it, and partly poised prominently in a row of inter-War semis W of the village along the road to Lockeridge.

These last houses occupy exactly a rectangular block of land backing on to and defined by the tithing boundary with Lockeridge and the C10 estate boundary with East Overton. This is characteristic of Fyfield: its undistinguished appearance belies its historical interest, and practically every apparently disparate component of the village can be explained historically. A key point is that Colt Hoare (1821, 80) recorded a 'rude pavement near the church.' Presumably this refers to its craftsmanship rather than its subject and to a Roman mosaic pavement and therefore a building, probably a villa. If so, it would have stood on the little bluff above the 'north' bank of the R. Kennet now occupied by the Church of St. Nicholas and the Georgian house on its N side. The bluff in fact faces east for at this point the Kennet runs north; but the fact is that Fyfield lies across the river from both Lockeridge and Overton.

A TS by an unknown writer in PJF's possession (and we can probably identify it) refers to the author's having 'located a short low bank protruding east, at the base of a wall supporting the built up terracing of the gardens of Fyfield House.' From this bank came 'sherds [presumably RB] and fragments of blue pennant sandstone roofing', characteristically building material from North Somerset of a Roman structure of C3-4 rather than earlier (*cf.* similar material from ODXII, *below* p. 00, and from Cadbury Congresbury, North Somerset, Rahtz *et al.* 1993). The report continues: 'Further sherds, roofing and hypocaust tile was [sic] found in the bank of the river [about 100 m. E]. A blue sandstone tessera with mortar still adhering was also picked up in the garden of the house further west, and beyond the area of made up ground.' (at which point my sheet of TS ends). In general there would seem little doubt that a Roman buildings or buildings existed over a W-E distance of at least 100 m. in the roughly triangular residential area between the present A4 and St. Nicholas church, bounded on the W by the road into Fyfield and on the E by a patch along the river bank.

A first phase of settlement can be postulated in the Roman period, with a villa on the riverside bluff standing back from the *Cunetio* road to the to its south. While there is a little uncertainty about the exact course of that road - the SMR, for example, takes it on an implausible route N of the village and the A4, - we accept its line as having gone along the N side of the former 'hollow-way', running E-W south of the village and followed by a straight length of the parish boundary. This 'Hollow Way' was also remarked on in the East Overton Charter, but sadly it has recently been filled in and is no longer visible. Though the Charter boundary turn S at the hollow way's E end, the Roman road probably passed on E to cross the Kennet at or close to the present bridge and then on along the minor road running S of the Kennet eastwards to *Cunetio*. This would place the villa some 300 m north of the road, but nothing else is known of this first putative 'Fyfield'.

In general terms the medieval village seems to have been, in contrast, on a N-S axis. The Church stood at the N end of a street which probably ran S at least to the E end of the `Hollow Way` and more likely towards the bridge across the Kennet by Lockeridge House (itself early C18 and later). This supposed village street is marked still by a right of way across low-lying and floodable land with earthworks surviving to each side of it. These might be the product of medieval desertion, but they could also be from an C18 fire which reportedly destroyed the village (CHECK THIS: WHERE DID I GET THIS INFOR??????).

Phase 3 is village shuffle to N of church E-W along A4

Phase 4 is modern village with destruction of E [art of Fyfield in road widening, subsequent Council housing to W, and modern infilling W of church
