

Appendix D – Graphical representations of the Bone Density Data

The Following pages contain a number of scatterplots of the data produced by this project. In each case, age at death (in years) is plotted against bone density. In the first 11 plots the preparation method used to deflesh the material is specified. In the second 11 plots the breed of the material is specified. The third 11 plots indicate the sex of the animals concerned. The final 11 plots differentiate between animals that died in different months of the year.

The ability of these plots to explore patterns within the data is somewhat limited (see section 8.2.1.1). Instead, these plots are intended to graphically display the data presented in appendix C in such a way that the broad nature of the data can be seen.
