

Figure 93: Looking east along river bank exposures that show basal diamicton, fluvial channel and bar-form gravels overlain by a 500 mm thick peat-bed and then overbank alluvium. The deposits are from terrace T4 of the lower Calder, near Whalley. The right hand end of the photograph shows the peat-filled back channel, whereas exposures of flood laminated organic-rich alluvial channel fill characterizes the left end of the section, which is from the centre of a palaeochannel
