Assessment of the Post-Roman Pottery from the A4146, Stoke Hammond and Linslade Western Bypass, Buckinghamshire

Alan Vince and Kate Steane

A collection of pottery from the Stoke Hammond and Linslade Western Bypass, Buckinghamshire collected by Network Archaeology Ltd was submitted to the authors for identification (Site code: A4146 – 06).

The pottery included one possible early Anglo-Saxon sherd but was mainly of medieval date with a small quantity of post-medieval and early modern material.

Description

Condition and Quantity

One thousand, four hundred and seventy-nine sherds were recorded (Table 1). Most come from sites D and E with small quantities from Sites A and C and other areas.

Table 1

Date	A	C	D	E	n/a	Grand Total
esax				1		1
mpot		1	877	543	17	1438
ppot	1	1	7	2	24	35
emod		1			4	5
Grand Total	1	3	884	546	45	1479

The pottery is fragmentary, with mean weight of 9.4gm per sherd and on average 1.9 sherds per vessel. The latter figure is mainly due to the finds from Sites D and E, which include some smashed vessels (Table 2)

Table 2

Eight hundred and forty seven sherds showed signs of post-depositional alteration (Table 4). This consisted of some rounding of broken edges (ABRA), rarely extreme (VABRA) and some leaching of calcareous inclusions, all of which appears to have taken place after burial rather than during use.

Early Anglo-Saxon?

A single sherd, residual in a medieval context on Site E, is handmade, black-fired and tempered with grog. Although grog is normally a prehistoric or Roman tempering material this

sherd is similar in manufacture and, so far as can be seen, shape, to early Anglo-Saxon vessels and grog-tempering has been noted previously by the author in the early Anglo-Saxon period in the south-east Midlands.

Medieval

One thousand, four hundred and thirty-eight sherds of medieval pottery were recorded, mostly from Sites D and E (Table 5).

No examples of St Neot's type ware were present. This ware, which contains abundant fine-grained shell fragments, was the sole late Saxon ware present at Loughton, Milton Keynes, c.12 miles NNE of the sites and would undoubtedly have been present if the site was occupied in the pre-conquest period. Furthermore, it is likely that the ware continued to be produced and used in the post-conquest period.

However, 248 sherds of Early Medieval Chalky Ware (EMCH) were present. These sherds are identical by eye to vessels found in the City of London from the mid 11th to the mid 12th centuries ({Vince & Jenner 1991 #9923}, 70-72). In London, this ware is most common in the mid 11th century, just before and after the Norman conquest, and declined in frequency in the later 11th to mid 12th centuries, after which it was no longer used.

If we assume that the A4146 vessels are from the same source, and that it did not continue in use longer in Buckinghamshire than in London, then these sherds suggest that sites D and E were occupied by the middle of the 12th century, at the latest. All the sherds come from jars and include 18 rim sherds which could be drawn and compared with the London finds.

Two hundred and sixty-three sherds of medieval shell-tempered ware (OLNEY HYDE) were present. A similar ware was being produced at Olney Hyde, about 20 miles north of the A4146 sites in the 12th to 13th centuries. The main difference between this ware and St Neot's type ware is the range of vessels. The A4146 vessels include bowls and dishes and a handled jar. However, in contrast to Olney Hyde, they include no sherds of jugs. Here too, the vessels seem likely to date to the mid 12th century or before.

The majority of the sherds are sand-tempered, handmade vessels (MEDLOC) probably including the products of several centres. Later medieval sand-tempered wares were produced to the northeast and east of the sites, at Brickhill, Everton and Flitwick (LMRW) and these vessels, although they differ in manufacturing technique and form, are similar in fabric and may be earlier products of the same area. Four sherds of jugs (two of which were glazed) and one sherd from a spouted pitcher were found. All the remaining sherds came from jars. Spouted pitchers were produced in the late Saxon period and continued in production and use into the 12th century. However, they are unlikely to have been used later than the middle of the 12th century, after which time jugs became common.

Two hundred and fifty-four sherds of Hertfordshire Reduced ware (SHER) were recorded. This ware was produced at several centres in Hertfordshire and Middlesex. All the sherds

recorded as SHER were wheelthrown and most were reduced to a light grey colour. Some, however, had been fired in an oxidized atmosphere and then reduced at the end of the firing, giving a dark grey surface.

Most of the sherds came from globular jars with a squared, flat-topped rim but parts of three handled vessels were recovered, which were probably narrow-necked jugs. Two of these handles joined the body at the top of the rim. This is a feature of early to mid 12th-century jugs in the east midlands and Yorkshire and not a typical feature of Hertfordshire Reduced ware jugs. It may be that these vessels too date to the mid 12th century. In addition, a thumb-decorated bung from a cistern was recorded. However, Hertfordshire Reduced ware was certainly in use well into the 14th century.

The remaining medieval pottery is all of types of later 12th to 14th-century date. It includes 12 sherds of mid 13th to 15th-century Brill/Boarstall ware (OXAM), 19 sherds of later 13th to 15th-century Potterspury ware (POTTERSPURY) and four sherds of early 13th to mid 14th-century Lyveden/Stanion ware (STANLY, all unglazed jar sherds). These sherds may be contemporary with at least some of the SHER sherds.

Post-Medieval

Thirty-five sherds of post-medieval pottery were recorded (Table 6). Most of these sherds are lead-glazed oxidized earthenware with a fine sand temper (less than 0.2mm across). They are visually similar to 17th-century material from Brill (PMBRILL). Examples with a black glaze, a mottled brown glaze and white slip on the interior (perhaps decorated with sgraffito) were recorded. Most came from bowls, but jars, handled jars, jugs and pancheons were also present. Other types are represented by single sherds: Brown-glazed earthenware (BERTH); Miscellaneous glazed red earthenware (GRE); Midlands Purple Ware (MP) and Martincamp ware. No examples of Staffordshire slipwares, which became increasingly common in the southeast midlands in the late 17th and early to mid 18th centuries, were recorded and the Martincamp ware sherd came from a red earthenware flask.

Early Modern

Four sherds of transfer-printed ware (TPW) of later 18th or 19th-century date and one sherd of Miscellaneous Refined Whiteware (WHITE) were recorded. One of these came from Site C and the remainder were from other sites.

Assessment

Site A

A single fragment of post-medieval pottery was recorded from Site A, probably dating to the 17th century (12093).

Site C

Three fragments of post-Roman pottery were recorded from Site C: A fragment of transfer-printed ware plate was recorded from context 32155; A fragment of an unidentified medieval jug, probably of later 12th to 14th-century date, was recorded from 32250; and a fragment of post-medieval pottery was recorded from 32253.

Site D

Site D consists of two excavated areas. The first, Trench 5, consists of a series of features – mainly gullies, associated with 12th to 13th century pottery. The second, the moat, consists of a moated site which contains post-medieval finds in its backfill.

Trench 5

One thousand and twenty five sherds of pottery were recovered from Trench 5. They represent no more than 826 vessels and weigh 6.662 Kg.

Most of the assemblages contain the same range of types, for which a mid 12th century date has been postulated above. There are no features whose fills produced only EMCH or other types for which an earlier date could be argued and most contain a mixture of handmade sandy wares (MEDLOC), Olney Hyde type shelly wares and Hertfordshire Reduced wares (SHER). A single truncated linear feature (F4117) produced sherds of handmade sandy and

wheelthrown shelly wares without any Hertfordshire Reduced ware. Although several of the features are intercutting, indicating that it was not a single-period occupation, there is no sign of any difference in the pottery assemblages (Table 7).

Table 7

context group	EMCH	MEDLOC	OLNEY HYDE	SHER
F4168/F4183	8	11	8	4
F4164		4		1
F4139	23	100	36	36
F4117		6	3	
F4110/F4137	8	90	18	23
F4108	1	13	1	9
F4012	41	151	39	17
F4009	10	82	33	10

A single feature produced later medieval pottery: Dump 4114 which produced sherds from two Potterspury vessels, a jug and a jar. This deposit probably dates to the later 13th century or later.

Only three horizons produced later post-medieval pottery: Various deposits of topsoil which produced a few sherds of later medieval and of post-medieval date; the fill of possible ditch F4107, a shallow silting or ponding horizon F4125.

It therefore seems that the Trench 5 activity was short-lived, beginning and probably ending in the 12th century and was then followed by the deposition of dump 4114 and slight post-medieval activity.

Five separate deposits of subsoil, interpreted as having been ploughed, produced pottery. Two of these pre-dated the medieval features (4008 and 4127/4128). These three deposits produced 31 sherds of pottery of the same types which occur in the fills of the medieval features. They are either intrusive from those features or indicate that those pottery types were already in use before occupation started on the site. The remaining three deposits seal medieval features (4133, 4135 and 4171). The potsherds are also of the same types as are present in the underlying features. A high proportion of these sherds were recorded as being leached and/or abraded (and in one case very abraded).

The Moat

Pottery was recovered from two features: F4045 – a possible ditch or inner moat and F4184, silting in the eastern moat arms. The moat silt produced two sherds of medieval pottery, probably of mid 12th to mid 13th century date, and the possible inner moat produced a sherd of post-medieval pottery (Table 8).

The lack of finds of mid 12th to 13th-century date contrasts with Trench 5 and suggests that the moat either post-dates the trench 5 settlement or was separated from it.

Table 8

context group	MEDLOC	PMBRILL	SHER	Grand Total
F4045		1		1
F4184	1		1	2
Grand Total	1	1	1	3

Site E

Five hundred and forty-six sherds of post-Roman pottery were recorded from Site E. The same range of wares was present on this site as on Site D. However, there is stronger evidence for a late 11th presence, in that four contexts produced solely sherds of EMCH: 60038, 60060, 60089 and 60105. However, these contexts only produced nine sherds in total and in some cases they are fills within features which contain later types, or are stratigraphically later that features containing these types. Only one feature which could conceivably date to the late 11th century survives these tests: F60089 which produced a single small sherd of EMCH jar (2gm).

Six contexts produced sherds of EMCH and OLNEY HYDE without later types: 60029, 60046, 60049, 60050, 60077 and 60093. In total these six contexts produced 26 sherds. Again, once theses contexts are compared with other fills from the same features and with the site stratigraphy only three features remain, all ditches or gullies: F60028=60062; F60047; F60061. These produced in total only 10 sherds.

Taken together, these features may represent a late 11th to mid 12th-century phase of occupation (Table 9). The low quantity of pottery present either indicates that the features were not close to areas of rubbish disposal or that the site was only sparsely occupied, or that pottery was not widely used. All of the features produced sherds which were noted as being abraded and/or leached. The sherds from F60047 are larger than from the other features, and include groups of sherds from the same vessels.

Table 9

context group	Context	EMCH	MEDLOC	OLNEY HYDE	Grand Total
F60028=60062	60029		1		1
F60047	60046	1	5		6
F60061	60060			2	2
F60089	60089	1			1
Grand Total		2	6	2	10

Fifteen contexts produced sherds of SHER and/or STANLY: 60031, 60034, 60035, 60043, 60051, 60054, 60070, 60075, 60076, 60095, 60102, 60103, 60106, 60110 and 60112 (a total of 295 sherds of which only 88 are SHER or STANLY). The features from which they were recovered can be subdivided into those containing flat roof tile and those without tile. This too may be a chronological subdivision.

The pre-tile phase (if such it is) consists of four features, two ditches and two pits (Table 10). All the sherds come from jars, including a handled jar in Olney Hyde-type ware.

Table 10

context group	Context	EMCH	MEDLOC	OLNEY HYDE	SHER	Grand Total
F60030=60064	60031	1	14	4	13	32
F60051	60050	1	1	3		5
	60051				1	1
F60055	60054	1	2	2	2	7
F60071	60070		1		1	2
Grand Total		3	18	9	17	47

The tile phase consists of six features: two pits, two ditches, a depression with a stony fill and a tree bole (Table 11). Most of the sherds come from jars but three of the Olney Hyde sherds could be from jars or bowls.

Table 11

context group	EMCH	MEDLOC	OLNEY HYDE	SHER	Grand Total
F60033	3	23	4	3	33
F60039			4		4
F60048	14	2		36	52
F60087	4	1		9	14
F60092	1	1			2
F60094		6		3	9
Grand Total	22	33	8	51	114

Six contexts produced sherds of later 13th-century or later medieval wares: 60002, 600044, 600069, 600073, 600078, and 600096 (194 sherds in total, of which only 15 are of later medieval types). Most of these contexts are from the fills of ditches (some, the upper fills of earlier features) and various deposits in the hollow way, F60074 (Table 12). Taking stratigraphy into account these features produced 259 sherds, mostly of types present in the earlier phases. Most of the sherds are from jars, but there are also sherds from bowls, a cistern (a SHER vessel with a spigot hole), jugs and a spouted pitcher. The wider range of forms is probably due in part to the fact that over twice as much pottery was recovered from these features as from all the earlier phases together. Two of these vessels should be illustrated (an Olney Hyde bowl and the MEDLOC spouted pitcher), although both are probably residual.

Table 12

context group	EMCH	MEDLOC	OLNEY HYDE	OXAM	POTTERSPURY	SHER	STANLY	Grand Total

F60101	35	10	6			4		55
Grand Total	50	91	77	9	2	26	4	259

A single sherd of post-medieval Brill ware was present in the topsoil, which also produced a possible sherd of early Anglo-Saxon pottery. Otherwise, both the topsoil and subsoil contexts produced a similar range of wares to those from the medieval features they overlay.

Other Finds

Forty five sherds were recorded from other contexts on the line of the bypass (Table 8). These include a small number of medieval sherds of similar character to those from Sites D and E but are mainly of post-medieval date.

Table 13

Key: 1 = late 11th to mid 12th-century types; 2 = late 11th to 12th-century handmade sandy wares (MEDLOC); 3 = SHER, 4 = POTTERSPURY and OXAM, 5 = Post-medieval wares; 6 = Early Modern wares.

Potential and Further Work

The pottery from Sites D and E probably provide glimpses of two similar, mainly mid-12th-century settlements and since it is rare to find rural medieval settlements with well-stratified material of this date (most medieval sites have a longer, more even period of occupation, or only begin to be occupied in the later 12th century) these finds deserve analysis and publication. A consideration of the relationship between these two sites and the wider landscape, including the moated site is also relevant to the overall research aims of the project.

The 55 sherds of pottery from the remaining sites is mostly from late deposits or is unstratified and further study of these is not required.

Stratigraphic Analysis

The pottery dating provided here can be used to determine whether more than one phase of occupation can be recognised in the stratigraphic record, and this information can then be used to re-examine the pottery sequence, to determine, for example, the degree of residuality on the sites. (Table 9 Task 1).

Determination of Source

Scientific analysis of late medieval Reduced ware from various sites in the south midlands could be used to compare with the MEDLOC fabric(s) to determine, firstly, whether or not there is any evidence for the pottery coming from more than one source and, secondly, whether or not that source, or sources, compare well with these comparanda (which come from Everton, Great Brickhill, Hitchin and Flitwick, Table 9. Task 2).

Similarly, comparative thin section and chemical data exist for EMCH (funded by the City of London Archaeological Trust) and it would be possible to test whether the vessels from the A4146 sites are made from the same raw materials as those found in the City of London. If so, this would be a remarkable case of long-distance provisioning of London at a very early date (Linslade and the City of London are c.52 miles apart. However, the ware may have been produced in a valley somewhere on the dip slope of the Chalk scarp and thus the distance travelled could be slightly less, Vince & Jenner 1991). Table 9. Task 3.

It would be possible to compare the shell-tempered ware from the A4146 sites with that from Olney Hyde itself, although samples from the kiln site would have to be analysed alongside the A4146 sherds. Table 9. Task 4.

A sample of the SHER vessels could be compared with various samples from production sites and consumer sites in the south-east Midlands: Linslade (Grove Priory, a consumer site), Nettleden, Chandler's Cross, Elstree, Pinner, Arkley, Kingston-upon-Thames, Hitchin, Little Munden and Caldecote (a consumer site). Table 9. Task 5.

Documentation

As part of the documentation of the collection, illustrations of some of the better-preserved vessels should be made (Table 9. Task 6).

Publication

The results of these recommended studies should be brought together and a report produced for publication (Table 9. Task 7).

Costings

Table 14

Task No	*Description*	*Unit Cost*	*Amount*	*Cost*
1	Stratigraphic examination of pottery data	£188 plus VAT per day	2 days	£376.00 plus VAT
2	Thin-section and chemical analysis of MEDLOC samples	£47 plus VAT per sample	18 samples	£846.00 plus VAT
3	Thin-section and chemical analysis of EMCH samples	£47 plus VAT per sample	6 samples	£282.00 plus VAT
4	Thin-section and chemical analysis of OLNEY HYDE samples	£47 plus VAT per sample	18 samples	£846.00 plus VAT
5	Thin-section and chemical analysis of SHER samples	£47 plus VAT per sample	6 samples	£282.00 plus VAT
6	Illustrations	In-house illustration by Network Archaeology (cost not included in table) plus checking and documentation time (AVAC) at £23.50 plus VAT per hour	2 hours	£47.00 plus VAT
7	Report	£23.50 plus VAT per hour	4 days	£752.00 plus VAT
Total				£3131.00 plus Vat
Total inc VAT				£4031.43

Retention

All of the stratified pottery should be retained for potential re-examination by future scholars.
