

Assessment of the Finds from Land to the rear of 13 St Augustine's Gate, Hedon (OSA06EV10)

Alan Vince and Kate Steane

A moderately large collection of finds was recovered from an archaeological evaluation carried out by On-Site Archaeology at St Augustine's Gate, Hedon (Site Code: OSA06EV10). The finds mainly consist of pottery with small quantities of ceramic building material, copper alloy, fired clay, glass, iron, leather, clay tobacco pipe and slag (Table 1). The finds were identified, recorded and quantified by sherd/fragment count, the number of objects represented and their weight in grams.

Description

Ceramic Building Material

Seven fragments of ceramic building material were recorded. They consist of a three pieces of flat roof tile and one unidentified fragment, which might be of medieval date, and two fragments of brick and one fragment of pantile which are likely to be of post-medieval date. All were of fine-textured red-firing earthenwares of potentially local origin although they were not examined in sufficient detail to determine whether the medieval pieces could be from the Beverley tiler.

Copper Alloy

A single fragment of a copper alloy fitting was recorded. The object might be a fitting from a piece of clothing (e.g. a belt) but looks similar to the hasps used on medieval books. It therefore requires specialist identification and, if necessary, a specialist report.

The Alan Vince Archaeology Consultancy, 25 West Parade, Lincoln, LN1 1NW

<http://www.postex.demon.co.uk/index.html>

A copy of this report is archived online at

<http://www.avac.uklinux.net/potcat/pdfs/avac2006087.pdf>

Fired Clay

Four fragments of fired clay were recovered. Three of these have vitrified surfaces and make be associated with smithing. They should be submitted to a specialist in archaeometallurgy for identification and assessment.

Glass

A small fragment of light green window glass and the base of a vessel (possibly a beaker) were recorded. The latter item requires special packaging and a conservation assessment. It also requires specialist identification and, if necessary, a specialist report.

Iron

Eight iron objects were recorded. Three were nails which require no further treatment. Two fragments might be teeth from heckle combs, (4mm diameter and over 74mm long and 5mm diameter and over 103mm long); one is a fragment of horseshoe, of later medieval or post-medieval character; one is a piece of curved and bent rod 5mm in diameter and one is a spoon of 18th century or later date. All these items, apart from the nails, require xradiography, a conservation assessment and specialist identification and report.

Leather

Four collections of leather were recorded. All appear to consist of small offcuts but require specialist assessment and, if necessary, a specialist report.

Clay Tobacco Pipe

Three fragments of clay tobacco pipe were recorded, one was a stem fragment without a measurable bore diameter and therefore only datable between the late 16th and the early 20th centuries. The other two were undecorated pipe bowls. Both are of forms known from Hull (Watkins 1979, type Ic, 1660-1675, and type IIh, 1660-1700).

Pottery

Roman

A single fragment of Roman pottery was recorded (RPOT in catalogue), a piece of samian ware bowl, probably of form Dr31. The lack of coarseware sherds suggests that this piece might have been collected in the medieval period although there was no sign of re-use (samian ware was thought to have curative properties and sherds with ground edges are known from medieval sites).

Medieval

There are no sherds of Anglo-Saxon date from the site and the earliest type present is Reduced Chalky ware (REDC), represented by three sherds. This ware was probably at its

most common in the late 11th and early 12th centuries but a mid 12th century date is conceivable.

The majority of the medieval pottery consists of later 12th to early 14th-century wares, most of which appear to have been made at Beverley. These have been coded according to their fabric (BEVOA – tempered with a calcareous sand and BEVOB – untempered) and according to their glaze (1 – splash glaze, 2 – suspension glaze). The combined codes indicate both fabric and glaze (Table 2). Broadly speaking, the earliest Beverley wares have a calcareous temper and splash glaze and the latest ones have no added temper and a suspension glaze. Thus, there are some early Beverley ware sherds in the collection, dating from the mid to the late 12th centuries, but the majority are probably late (late 12th to mid 14th century). Few of the Fabric A sherds come from decorated vessels, apart from a single thumbed jug base. Thumbing is a feature which became very common in the early 13th century but was present at Beverley by the 1180s, to judge by a collection from Lurk Lane, Beverley, which is probably debris from a documented fire of that date (Watkins 1991 #46263). The six sherds of splash-glazed fine fabric also have no decoration or other features. The remaining sherds include sherds from jugs with applied decoration, some simple strips but others possibly from plastic decoration (such as figures and animals); vessels with stamped bosses (a 14th-century feature in the Beverley industry); combed and grooved lines; pulled spouts; strap handles; and two sherds from a tubular spouted jug, a late 12th to early 13th-century form in the Beverley industry.

BEVOB	None		150	135	1629
Grand Total			428	403	4372

Ten sherds of Staxton-type ware were present (STAXT). This type is a regional tradition produced at several sites, but probably including the Beverley pottery itself. The tradition is said to be long-lasting, starting in the mid 12th century and continuing into the late 14th or 15th centuries. However, most of the examples from the Humber basin date to the earlier part of this period.

Only 26 sherds of mid 12th to mid 14th-century date not from or probably from the Beverley industry were found. Of these, a single sherd was imported, from Rouen (an early to mid 13th-century sherd) and the remainder are regional imports: from the North Yorkshire whiteware industries (Brandsby-type ware – BRAN, York Glazed ware – YORK and Scarborough ware - SCAR); the south Yorkshire whiteware industries (DONCB – Doncaster

Hallgate Fabric B); Developed Stamford ware – DEVS) and a sherd of unknown origin – MEDX – which might be of Flemish origin).

Later medieval pottery consists of Humberware (HUM, all of Watkins' Humber 1 group) and a single sherd of Dutch Red Earthenware, a type which continued in use into the 16th century.

The Humberware consists of jugs (23 examples), jars (only 4 definite examples) and a number of sherds which might be either form.

There were 88 sherds of post-medieval pottery from the site; these include 14 sherds of Humberware with a vitrified brown wash (Watkins' Humber 5 type); glazed red earthenwares (GRE); Late Humberware (LHUM), Blackware (BL) and Cistercian-type ware (CSTN). All of these red earthenware types could be of local origin or regional imports. Definite regional imports consist of press-moulded slipwares (STCO); Midlands Yellow ware (MY); and wheelthrown slipware made from a Coal Measures clay (STRE).

Possible imports consist of Raeren stoneware (RAER); Frechen stoneware (FREC); a sherd of either Dutch Red Earthenware or English Glazed Red Earthenware (GRE/DUTR) and a sherd from a tin-glazed bowl, decorated in blue both inside and out (TGW).

These post-medieval sherds include some which date from the mid 16th century or earlier (CSTN and RAER); some which date from the later 16th to mid 17th century (MY and FREC) and some which date to the late 17th to mid 18th century (STCO). The remainder cannot be closely dated intrinsically.

Eight sherds of early modern date were recorded. Of these, a sherd of Creamware (CREA), a sherd of Pearlware (PEAR) and two transfer-printed sherds (TPW) might be of late 18th century to mid 19th century date whilst four sherds of buffware (NCBW) are of early 19th-century or later date.

TPW	2	2	8
Grand Total	8	7	67

Slag

A small collection of slag was recorded. This consists of 7 fragments, weighing in total 876 gm. This material requires specialist identification and, if necessary a specialist report.

Assessment

Late 12th to mid 13th centuries

The earliest deposits investigated consisted of pits and post holes cutting through natural yellow clay and sealed by deposits of silt (1030) and overlying clay (1029). The finds from these deposits form six assemblages, from postholes 1034 and 1047 and from pits 1032, 1037, 1039 and 1050 (Table 5). Calcareous-tempered Beverley wares are found in all but one of these assemblages, but only form the majority of Beverley wares present in one, the fill of posthole 1034, which cut a feature producing early 13th-century pottery. Furthermore, non-local pottery of later 12th-century or later types (DEVS, DONCB, SCAR, YORK) are present in the fills of posthole 1047 and pits 1037 and 1050. The latest feature, from the pottery, is probably Pit 1037, which produced two sherds of Scarborough ware, and most of the other features are stratigraphically later than this. It therefore seems that activity started in the later 12th century but was mainly during the early/mid 13th century.

Table 5

Grand Total	1	5	52	31	48	1	1	3	2	6	1	151

The silt and clay deposits which seal these features, 1030, 1029 and 1028, produced a large assemblage of pottery, of similar character to that from the features themselves. Each of these deposits produced Scarborough ware whilst two produced York Glazed ware and one, the sherd of Rouen ware. Two sherds of later date were present, both in silt/levelling layer 1030 (a sherd of Dutch Red Earthenware and a sherd of either glazed red earthenware or Dutch Red Earthenware. At the earliest, these sherds could date to the later 13th century but are probably much later.

Grand Total	142	96	27	7	6	6	4	4	1	1	1	295

Almost all the layers stratified above clay 1028 contain Humberware, post-medieval or early modern types, although with a high proportion of earlier medieval wares as well. The latter are interpreted as being residual since they include sherds of types which are typical of the 12th century. A series of dumps overlying clay 1028 (Table 6) might date to the later medieval period or the post-medieval period, depending on the identity and status of two glazed red earthenware sherds from context 1024 and the Humber 5 sherd from context 1025.

Grand Total	3	2	15	20	

Pottery associated with a brick and cobble surface and possible beam slot is consistent with a later 16th-century or later date for these features (Table 7) whilst an overlying layer of clay/silt (1009) produced only finds of similar or earlier date as did the fills of two post holes (1006 and 1008).

Table 7

Context	CSTN	FREC	GRE	HUM	Grand Total
1012	6	4	1	1	12
1013			1	3	4
1015				2	2
Grand Total	6	4	2	6	18

These deposits were then covered by garden soil (contexts 1001, 1002 and 1061). Pottery from these soils is mostly of similar character to that in the deposits below but includes three sherds of late 17th to mid 18th-century slipware.

Finds were recovered from other, isolated, features. They date those features mostly to the late medieval period or later (clay/silt 1074, cobbled surface 1062); the later 16th century or later (dumped silt 1068; pit 1058) or the late 18th century or later (brick drain 1069; posthole 1055; sand overlying collapsed brick oven, 1073).

Further Work

The site has produced well-dated finds assemblages which throw light on the early history of Hedon.

The glass, copper alloy, leather and iron finds require a conservation assessment and, in the case of the iron, xradiography. NB NO ESTIMATE IS GIVEN HERE FOR THIS WORK.

The fired clay, slag and leather all come from 12th to 13th century deposits and therefore should be assessed by specialists to determine whether a full study would throw light on activities taking place on the site at that time. They appear, from initial assessment, to

indicate the presence of smithing and leatherworking. Most of the iron also comes from these deposits and its study might confirm or refute the suggestion that wool combing took place on the site.

The remaining non-ceramic finds (the copper alloy hasp and the glass) come from the later, less well-dated deposits and their specialist study therefore has less potential.

The pottery is mostly of local origin and of types which are well-known from excavations in Beverley and, to a lesser extent, Hull. Given the documentary evidence for Hedon's early trading function it would be worthwhile publishing the 12th to 13th-century pottery. This would require no illustration but it would be useful to confirm the identification of the non-local wares (Table 8). The ten sherds of Staxton-type ware should also be examined in greater detail to establish whether they are of Beverley area or other origin. Provision should be made for a single thin section and chemical analysis as well.

Table 8

Task	Cost	Total
Specialist study of leather and iron (Q Mould)	4 hours at £31.25 per hour	£125.00 plus VAT
Specialist study of slag and fired clay	4 hours at £31.25 per hour	£125.00 plus VAT
Identify Rouen, Doncaster, and York Glazed wares, using thin section and chemical analysis	3 samples at £48.00 plus VAT (including report)	£96.00 plus VAT
Binocular microscope study of Staxton-type ware	2 hours at £24.00 plus VAT per hour	£48.00 plus VAT
Identification of Staxton-type ware	1 sample at £48.00 plus VAT	£48.00 plus VAT
