### **Summary**

An archaeological evaluation was undertaken on an area proposed for development. A total of 67 trenches and 2 trial pits were excavated, covering 7.28% of the overall available area. Field drains and evidence for tree growing was encountered, along with a fragment of clay pipe and a cow neck chain, all of probable 19<sup>th</sup> or 20<sup>th</sup> century origin. As such, despite the high number of features (504) it is unlikely that further archaeological work will be required as part of this development. This is subject to advice from the Lead Curator of Local History and Archaeology at Aberdeen City Council.

# Report on an Archaeological Evaluation of Land at Pinewood, Countesswells Road

## 1. Introduction

- 1.1 The site, targeted by archaeological evaluation, is within the parish of the city of Aberdeen at NGR NJ 89949 04649 (Illus 1). It lies to the north side of Countesswells Road, to the south of Hazledene Road, to the west of Ben Reid Nurseries and to the west of a residential area (Countesswells Crescent and Burnieboozle Crescent). The land has been proposed for a residential development with related access roads (Aberdeen City Council planning reference 89/2178). This archaeological work forms part of a pre-planning process to a standard evaluation requirement covering 7% excavation of the total area proposed for redevelopment.

Illus 1: Area Targeted by Archaeological Evaluation (outlined in red)

- 1.2 The archaeological evaluation was commissioned by Alan Massie of Allyn (Aberdeen) Ltd, and was undertaken between Monday 20<sup>th</sup> February 2012 and Wednesday 28<sup>th</sup> March 2012. It was carried out in the context of Scottish Planning Policy (SPP) Planning Advice Note 42 (PAN 42) and Scottish Historic Environment Policy (SHEP). The archaeological written scheme of investigation (Cameron 2012), approved by the Aberdeen City Council Lead Curator of Local History and Archaeology, was adhered to in full

## 2. Archaeological Background

- 2.1 No known previous archaeological works are known to have been undertaken within the evaluation area. One known SMR site does lie within the site boundary, Slopefield Quarry (SMR identifier NJ90SW 154; Illus 2), in the far south-western corner of the site, but this lies in an area earmarked for public open space, therefore an area not targeted by the archaeological evaluation as it will remain undisturbed. An assessment of early mapping of the area (Cameron 2012) has revealed that the area has been used for agricultural purposes since at least the 18<sup>th</sup> century, with no buildings or features depicted within the site boundary.

*Illus 2: Slopefield Quarry site as at March 2012*

### 3. The Evaluation

- 3.1 The evaluation area comprised a total of 14 fields lying within the site boundary (Illus 3). These were evaluated in an approximate clockwise direction, each field rapidly surveyed, and subjected to a 7% excavation of their total area.

*Illus 3: Showing Fields Comprising Archaeological Evaluation Area*

- 3.2 Each field was excavated in linear strips to cover an approximation of 7% of each field. Existing boundary dykes, access tracks, areas of conifer plantation, areas of bog and areas of excessive dumping as

well as areas beneath and within 9m of powerlines were not included in the total area. Also excluded was the small triangular area in the south-east corner of the boundary where Slopefield Quarry lies, as this area will remain undisturbed by any redevelopment, as a public open space.

- 3.3 The fields varied in size, the smallest, Field 3, covering an area of 3916.97m<sup>2</sup> and the largest, Field 14, covering an area (not including inaccessible areas) of 20490.48m<sup>2</sup>. Hence the number of trenches excavated in each varied from only two in Field 3, to a total of twelve in Field 14, plus an additional two targeted trial pits. All trenches measured 1.8m in width. The majority of the fields had between three and seven trenches located in them (Illus 4).

Illus 4: Showing Trenches Excavated During Archaeological Evaluation

- 3.4 A total of 1342.8m of trenching was excavated in Field 1 across five trenches which were all excavated on a west/south/west to east/north/east alignment. The shortest was Trench 5 which was 125m long, and the longest was Trench 4 which was 166m in length. They

revealed a dark brown silty topsoil of between 0.2m and 0.5m thickness overlying a grey and orange sand with clay inclusions. A total of 19 features were encountered in Field 1; 12 stone drains, 6 ceramic drains and one area of plough marks made by a subsoiler (Illus 5).

*Illus 5: Feature 1, plough marks made by subsoiler*

- 3.5 Field 2 contained five trenches (Trenches 6-10) which varied in length from 127m (Trench 6) to 184m (Trench 10) and had between 0.2m and 0.5m thickness of dark brown silty topsoil overlying an orange silty sand. A total of 29 features were observed in Field 2, 13 ceramic drains, 11 stone drains, 3 plastic drains, 1 area of rocks and 1 area of plough marks. Field 3 contained two trenches, 70m in length (Trenches 11 and 12) containing a silty dark brown topsoil between 0.2m and 0.5m in thickness overlaying an orange sandy loam. Each trench contained 9 features, totalling 18, all of which were stone drains (Illus 6).

*Illus 6: Feature 121, an example of a stone drain*

3.6 Field 4, to the south of Field 3 and east of Field 2, contained 3 north-west to south-east aligned trenches (Trenches 13-15) between 152m and 155m long. They revealed a dark brown silty topsoil between 0.3m and 0.45m in thickness overlaying an orange sandy loam. 15 features were observed in the Field 4 trenches, 12 of which were stone drains and 3 of which were ceramic drains. Field 5, in the far north-eastern corner of the site, had two trenches excavated within (Trenches 16 and 17) it on a west-south-west to east-north-east alignment each containing a topsoil of a loose dark brown silty nature above an orange stoney sandy natural. A total of 9 stone drains and one stone hole were observed within these two 165m long trenches. Field 6 also contained two trenches (Trenches 18 and 19) and was located to the south of Field 5. The trenches averaged 160m in length and contained a loose dark brown silty topsoil between 0.2m and 0.4m thick on top of an orange silty sand. Seven stone drains and a stone hole were recorded in these trenches. Field 7 contained three trenches (Trenches 20-22) which between them contained 29 features; 25 ceramic drains (Illus 7), three stone drains and a stone soakaway pit. The same dark-brown silty topsoil overlay a silty sandy natural.

*Illus 7: Feature 270, an example of a ceramic drain*

3.7 Field 8 was located to the south-east of Field 7 and contained three east-north-east to west-south-west aligned trenches (Trenches 23-25) revealing a total of 8 features, all of which were ceramic drains. The topsoil was a loose dark silty soil and the natural, an orange sand, comparable to the other fields. Field 9 was to the south-east of Field 8 and a total of five trenches were excavated within (Trenches 26-30) each revealing a dark brown silty topsoil between 0.25m and 0.4m in thickness overlying an orange sandy clay. Thirty three features were encountered within these trenches, 25 were stone drains, 5 ceramic drains, 2 were particularly stoney parts of the natural and one was the line of the main drain which was left undisturbed. Field 10 contained a particularly high density of features within its 6 trenches (Trenches 31-36); 121 in total (Features 229-350). The vast majority of these were stone or ceramic field drains although a black plastic water pipe was also observed across several of the trenches and a cast iron pipe, not noted on known service plans of the area. A further 76 features were encountered in the 6 trenches in the adjacent field to the west, Field 11 (features 351 to 422 and 501-4) and these again, all related to field drainage, except the cast iron pipe, suggesting that Fields 10 and 11 were particularly liable to flooding or standing water problems. In addition, in Trench 42, the closest to the Pinewood House Farmstead, a fragment of clay pipe was encountered inscribed with an 'S' and 'J' either side of the bowl base (Illus 8: not retained).

*Illus 8: Clay Pipe find from Trench 42, Field 11 (not retained)*

- 3.8 A total of seven trenches (Trenches 43-49) were excavated in Field 12, located to the south-east of Field 11, each measuring either 116 or 117m in length. Twenty seven of the features encountered were stone drains, four were ceramic drains and one was a dump of stones for drainage. Also within the trenches, a dark-brown silty topsoil measuring between 0.2m to 0.4m was encountered on top of an orange sand. Field 13, at the southern extent of the site, had some areas that were inaccessible to excavation, a strip towards the southern edge of the field where overhead powerlines were sited, and a strip along the eastern extent of the field where a strip of surviving conifer plantation was still in place. These areas were subtracted from the total area available for evaluation trenching, leaving a total of 7 trenches excavated in Field 13, 6 on a north-west to south-east alignment (Trenches 43-49), and one on an east-west alignment adjacent to Countesswells Road (Trench 56). Trench 50 was the shortest, at 90m in length, with Trench 56 being the longest, measuring 173m. In each, a mid-brown sandy topsoil overlay an orange/grey sand with rock occurring in some areas. Eleven stone drains, 5 ceramic drains and one dump of stones for drainage were noted from Field 13. Field 14 was the largest field within the evaluated area, and was located to the east of Fields 12 and 13. Much of the southern half of the field was largely inaccessible due to extensive dumping in the area, including all the rock and rubble from the recent Robert Gordon College Sports Ground development to the south (Head Groundsman, *pers. comm.*: Illus 9).

*Illus 9: Area of extensive dumping in Field 14*

- 3.9 A total of 11 trenches were excavated within Field 14, all on a west-south-west to east-north-east alignment, and only two of which were in the southern half to test the higher ground level in the eastern part of the field where rubble was not as extensive. These southernmost trenches (Trenches 66 and 67) showed a double thickness of topsoil, suggesting that this is where the soil from the sports ground development had been deposited. The topsoil was up to 0.7m deep in some parts of the trenches (Illus 10).

*Illus 10: Area of deep topsoil in Trench 67*

- 3.10 The other trenches had a loose dark-brown silty topsoil of between 0.3m and 0.4m thick overlying an orange sandy natural. In the field as

a whole total of 33 features were encountered in Field 14, including 23 stone drains, 5 water pipes, 3 ceramic drains, 1 cast iron pipe and 1 underground stone culvert drain which ran the length of the field, and was also said to have run beneath the boundary dyke between Fields 12 and 13 (John Fraser of Pinewood View House, *pers comm.*). This was 0.75m in width and 0.38m in depth and was targeted by Trial Pits 1 and 2. Trial Pit 2 was too close to the wet and boggy area and filled up with water before any detail could be seen. The culvert was recorded in Trial Pit 1, however (Feature 486; Illus 11 and 12).

*Illus 11: Feature 486 from above*

*Illus 12: View inside Feature 486 facing east-north-east*

- 3.11 In the topsoil of Trench 65 a cow neck chain or halter was found, used for fastening cows in stalls to ease farm management (not retained). These were widely used by pastoral farmers up until around the late 20<sup>th</sup> century (Illus 13).

*Illus 13: Demonstrating the cow neck chain (not retained)*

## **4. Conclusions and Recommendations**

- 4.1 The high number of archaeological features (504) encountered during the evaluation is exaggerated by the fact that many of the drainage features encountered will have been numbered more than once if the same feature was seen in more than one trench. Offsetting this, is the fact that numerous tree bowls were also encountered, particularly in the northern part of Field 14, which were not individually noted due to the known previous landuse of the fields as plantations for trees by Ben Reid Nurseries since around 1860. This use was only discontinued about 10 years ago, making such findings predictable. In addition, despite the high number of archaeological features, most relate to field drainage systems used over the past two hundred years, and as such, are not of high archaeological value. Full details of the locations of all features will be available with the site archive, found under the unique identifying code CA072-2012. Appendix 1 provides the summary table of features. Perhaps the best example of such features was Feature 486, the stone culvert drain, uncovered in Field 14. Despite known agricultural landuse of the area for at least the last two hundred years or so, very little in the way of pottery fragments were noted from the topsoil, although the finds of the clay pipe fragment and cow neck chain were of interest and tie in with this agricultural past. Unfortunately, as the cow neck chain was located so close to the area of dumping in Field 14, its true origin cannot be conclusive.
- 4.2 In total, the 67 trenches and 2 trial pits accounted for 7.28% of the total area available to excavation at this stage. This report on the evaluation forms the final stage of the archaeological evaluation process. Any decisions on requirements for further work on this site lies with the Lead Curator of Local History and Archaeology at Aberdeen City Council.
