SUMMARY

Between the 4th May and 11th June 2004, Oxford Archaeology (OA) undertook a field evaluation on land between Meath Green Lane and the River Mole on the north-west outskirts of Horley, Surrey. Further trenching was undertaken along a proposed access route which ran west of the River Mole to the A217 Reigate Road.

The evaluation identified a significant late Iron Age to early Roman area of settlement and associated field systems to the east of the River Mole, along with large number of post medieval pits.

No features of archaeological significance were identified along the proposed access route, but the existence of a filled-in river meander containing an alluvial sequence was confirmed immediately to the west of the River Mole.

22

1 INTRODUCTION

1.1 Location and Scope of Work

1.1.1 Oxford Archaeology (OA) were commissioned by Landscape Design Associates on behalf of Horley North West Consortium to undertake an archaeological evaluation at Horley, Surrey. The investigations formed part of a pre-planning application assessment of the proposed development site, and the results are to be incorporated into an overall Environmental Impact Assessment report (EIA):

1.1.2 The Study Area comprised five fields to the west and south-west of Meath Green Farm, Horley, bordered by the River Mole to the north and west. A proposed access road running west of the River Mole to the A217 Reigate Road formed an additional phase of evaluation (Fig. 1).

1.2 Geology and Topography

1.2.1 The Study Area encompassed an area of *c* 115 ha, sloped at a mild gradient towards the east, and had a mean elevation of 55 m AOD. It is currently under the tenancy of several farmers and was in part utilised as arable and grazing land. The majority of the site is situated over Weald Clay with interspersed areas of river terrace gravel and alluvial material (British Geological Survey, 1979, Sheet 283), with alluvial deposits concentrated along the course of the River Mole and its associated tributary stream system.

1.3 Archaeological and Historical Background

1.3.1 All work was carried out in accordance with a Written Scheme of Investigation approved by Surrey County Council (OA 2004).

1.3.2 The majority of information regarding the development area has been collated through the examination of information held by the Surrey Sites and Monuments Record (SMR). There are limited references to the proposed development area within the record although this does not dismiss the possibility of the existence of previously unidentified archaeology being present in the vicinity.

1.3.3 A single Neolithic polished axe fragment (SMR 872) was found in a field by a stream within the area to be covered by the EIA. The fragment was recovered in 1956 but was only reported by the person to whom the artefact had been left. Therefore, although interesting from the aspect of occupational continuity and anthropogenic movement through the Surrey landscape, this singular piece is rather unreliable as a single diagnostic artefact.

1.3.4 Although no archaeology pertaining to the prehistoric can be attributed to the immediate area of the development site, the possibility cannot be completely dismissed. Bronze Age occupation has been recorded by Framework Archaeology at Gatwick Airport (Framework, 2002) which is located *c* 6 km to the south-west of Horley along the course of the River Mole. Here ditch and pit alignments were

identified relating to Bronze Age ring ditches, settlement and field systems. This may suggest a smaller but similar system in character to that exposed along the gravel terraces of the Thames valley landscape to the north-west.

- 1.3.5 The main reference to the archaeology at the Horley NW development is that of a medieval moated enclosure (SMR 871). Excavations undertaken in 1963 produced 14th century pottery but little else. The enclosure was recorded as being orientated NW-SE with approximate dimensions of 50 m x 45 m. The line of a former road or track is visible along the southern side with the entrance potentially located on the NW side of the enclosure. A remnant bank was previously recorded as visible along the SE edge of the enclosure by the SMR record compiler. As this site appears to be one that was well established it is likely that the area was well utilised prior to this particular phase of the location.
- 1.3.6 A lime kiln has also been reported to exist within the western edge of the Horley NW development area (SMR 405). It is described within the SMR as a kiln dating between the 16th and 19th centuries, however the area if the kilns recorded location was subject to a geophysical survey (GeoQuest Associates, 1999), however negative results inferred the uncertainty of the SMR entry.
- 1.3.7 The examination of historic maps of the Horley area has enabled a securely identified pattern of the development of the town since the 16th century. The earliest map compiled by John Norden in 1594 records the existence of Horley as a small Hamlet. The settlement was sustained by a rural economy based on agriculture, and remained so up to the first half of the 19th century, (as shown by the Tithe Map of the Town of Horley in 1846). This continued to be the case although the settlement had grown slightly in the 250 years since Norden's original map.
- 1.3.8 It has been communicated by one of the tenants of the area that the land has been kept free draining through the mixed alluvial deposits via a sequence of herringbone plan land drains regularly laid in 22 m intervals. These were rumoured to have been laid by Napoleonic prisoners of war approximately 1.2 m below the ground surface and are constructed from clay drains of diameters between 7 to 10 cm.
- 1.3.9 By 1872, the 1st Edition Ordnance Survey Map showed a significant expansion towards the south east of the town. It is possible that this provisional and significant expansion of the Horley settlement was directly attributed to the increasing commercial popularity of the London to Brighton Railway constructed in 1841.
- 1.3.10 During the 20th century the settlement area continued to expand within the concentrated area of the south and east. This influx of the local population and of the town plan can be associated with the desirability of the area with respect to the London commuters' catchment area. The increased development through the latter half of the 20th century can be directly linked to the initial construction and subsequent expansion of Gatwick Airport, located to the south-west of Horley town.
- 1.3.11 A Geophysical survey (Geoquest 1999) undertaken along the route of the proposed access road west of the River Mole highlighted a possible infilled river meander at the extreme east of the route with a possible ditch and bank feature approximately 50 m west of the river.

2 EVALUATION AIMS

- 2.1.1 The aims of the evaluation were to determine the location, extent, date, character, and state of preservation of any archaeological remains surviving on the site.
- 2.1.2 Attention was to be given to remains of all periods. This was to include evidence for past environments. Provision was made for environmental sampling.
- 2.1.3 The evaluation sought to clarify the nature and extent of any modern disturbance and intrusion on the site.
- 2.1.4 An aim was to make available the results of the evaluation.

3 EVALUATION METHODOLOGY

3.1 Scope of Fieldwork

- 3.1.1 A 4% sample of the 125 ha site area was required. This entailed the excavation of 105 trenches 25 m in length and 2 m wide (Fig. 2). Two extra trenches were excavated to clarify the nature of the archaeology at the extreme west of the site and a third was excavated between trenches 41 and 51. These additional trenches were excavated in agreement with Tony Howe, Archaeologist, Surrey County Council.
- 3.1.2 The investigation work along the course of the proposed access route west of the River Mole comprised the excavation of a further 13 trenches.

3.2 Fieldwork Methods and Recording

- 3.2.1 The trenches were surveyed in by Mouchels Ltd using a total station theodolite (TST). Levels were taken relative to Ordnance Datum.
- 3.2.2 The trenches were excavated using a 360° mechanical excavator fitted with a toothless ditching bucket and directed by an archaeological supervisor. Excavation proceeded to the first archaeological horizon, or to the underlying natural geology, whichever was reached first.
- 3.2.3 A representative sample of the features revealed were excavated by hand to determine their depth, extent and nature, and to retrieve finds and environmental samples. Where finds were visible in the surface of unexcavated features these were retained. All features and deposits encountered were issued a unique context number. The spoil tips were inspected visually for the presence of artefacts.
- 3.2.4 A plan was drawn of each empty trench at a scale of 1:100 and of each trench with archaeology at 1:50. Each excavated feature was recorded in section at 1:20 and one metre wide sample sections of each trench were drawn at 1:20. Trenches and sections were photographed using colour slide and black and white print film. Recording followed procedures laid down in the *OA Fieldwork Manual* (ed. D Wilkinson, 1992)

3.3 Finds

- 3.3.1 Finds were recovered by hand during the course of the excavation and bagged by context in accordance with the *OA Fieldwork Manual* (OA 1992).

3.4 Palaeo-Environmental Evidence

- 3.4.1 Samples were taken from selected features to assess the likely preservation and quality of environmental data pertaining to the environmental history of the local area.

3.5 Presentation of Results

- 3.5.1 A general description of the soils and ground conditions is given. This is followed by descriptions of the individual trenches and finds, with a brief discussion of the results.
- 3.5.2 Details of individual contexts are given in Appendix 1.

4 RESULTS: GENERAL

4.1 Soils and Ground Conditions

- 4.1.1 The evaluation was carried out in generally fine and dry conditions. The archaeological horizons encountered quickly dried out to a hard consistency and weathering of the excavated surfaces made definition of more ephemeral features difficult. Intermittent periods of rain quickly caused standing water to form suggesting poor drainage.
- 4.1.2 The tenant farmers indicated that the site is prone to seasonal flooding.

4.2 The Stratigraphic Sequence

- 4.2.1 The site demonstrated a fairly uniform geology comprising alluvial clay silt subsoils of approximately 0.40 m thickness overlying drift deposits of heavily iron panned silt clay and sandy silts with gravel.
- 4.2.2 Trenches closer to the River Mole to the west of the site were generally sandier than elsewhere on the site.
- 4.2.3 Wealden Clay was encountered in deep excavations of pits in Trenches 51, 58, 91 and 92 at approximately 1.40 m below the present ground surface.
- 4.2.4 No evidence was encountered during the evaluation to indicate any significant plough damage of archaeological deposits. Preserved sequences of subsoil deposits were recorded in trenches 51, 67 and 74 and the pottery recovered was generally only marginally abraded.

5 RESULTS: DESCRIPTIONS

5.1 Distribution of Archaeological Deposits

- 5.1.1 The evaluation demonstrated there to be five distinct concentrations of archaeological features of Late Prehistoric and Roman date across the site.
- 5.1.2 These comprised as follows:
- Trenches 3, 5, 6 and 10 - 12. (Figs. 3-5) An area of heavily weathered and leached features comprising ditches, pits and possible post holes to the north of the site. The highly weathered nature of features in this area and the flints recovered suggest a prehistoric date.

- Trenches 21, 29 and 36. (Figs. 6-7) An area to the east of the site with postholes and ditches suggesting the location of prehistoric settlement. Features in these trenches were less ephemeral.
- Trenches 15 - 17, 23, 25, 27, 40 - 44, 51 and 105. (Figs. 8-12) An area across the centre of site with numerous ditch like features with some pits and postholes suggesting a prehistoric agricultural landscape on the periphery of settlement.
- Trenches 81 - 82, 86 - 87, 93 - 96 and 100 - 101. (Figs. 13-17) An area to the south of the site with a very dense concentration of ditch, pit and posthole features of probable Late Iron Age date suggesting probable settlement.
- Trenches 46, 48 - 49, 56 - 60, 67 and 69. (Figs. 18-22) An area with ditches and postholes from which Late Iron Age and Roman pottery was recovered.

5.1.3 No evidence was encountered for any significant post Roman use of the site until the post medieval period. A total of 193 post medieval pits were identified within the trial trenches across the southern half of the site, south of an approximate line from Trench 50 through 51 to 74. Two post medieval ditches were investigated in Trench 74.

5.1.4 No significant archaeological features were identified on the road strip on the west side of the River Mole. The presence of a probable ancient meander with an alluvial sequence was identified in Trench 120.

5.1.5 Each of the separate areas of prehistoric and Roman activity will be discussed in turn in the following trench descriptions followed by a description of the post medieval features.

5.2 Trench Descriptions

5.2.1 Trenches 3, 5 - 6, and 10 - 12 (Figs. 4 and 5)

Trench 3 (Fig. 4)

5.2.2 A single feature, (304) was identified towards the centre of the trench. This comprised a ditch terminal or pit running from under the southern edge of the trench and sealed by the subsoil (302). The feature contained a single blue/grey silty clay fill (305) containing two flints.

Trench 5 (Fig.4)

5.2.3 This trench contained four features (504, 506, 508 and 510.) All these features were sealed by the subsoil (502.)

5.2.4 A shallow ditch (504) on a north - west, south - east alignment crossed the eastern end of the trench. The single fill (505) of this feature was a very pale weathered silty clay with mineral iron leaching from which flints were recovered.

5.2.5 An irregular pit like feature (506) was investigated. This was an irregular oval in shape with well defined edges but an uneven base. The single fill (507) was a pale,

weathered silty clay from which a flint was recovered. The irregular shape and base of this feature suggests that it may be a tree throw.

- 5.2.6 A narrow gully (508) entered the centre of the trench from under the northern edge before terminating. This feature had a well defined V profile and contained a single pale silty clay fill (509)
- 5.2.7 A small segment of a possible pit or ditch terminus (510) was identified at the extreme eastern end of the trench. This feature had well defined edges and a flat base. The single fill (511) was a pale greyish silty clay from which a fragment of medieval pottery was recovered.

Trench 6 (Fig. 4)

- 5.2.8 This trench contained four features (605, 611, 613 and 615). All these features were sealed by the subsoil (602).
- 5.2.9 A ditch like feature (605) crossed the trench on a west-north-west, east-south-east axis. The edges of this feature were difficult to define on the surface of the trench but became more even into the flat base. The main fill (604) was a pale blueish grey silty clay into which probable rooting (607) and (609) had penetrated. A flint was recovered from 604.
- 5.2.10 A pit or ditch terminus (611) was investigated where it entered the trench from under the eastern edge. This feature was poorly defined on the surface of the trench but became more even on excavation with steep sloping sides and a flat base. This feature contained a single pale greyish silt clay fill (610).
- 5.2.11 A possible ditch like feature (613) was identified running approximately parallel to ditch 605. This feature was poorly defined in plan and appeared to narrow to the west. A land drain passed through 613 on a north west - south east alignment. The single fill (612) of 613 comprised a pale bluish grey silty clay.
- 5.2.12 A posthole (615) truncated the southern edge of ditch 613 against the western side of the trench.

Trench 10 (Fig. 5)

- 5.2.13 Eight features were identified in this trench (1004, 1006, 1008, 1010, 1012, 1014, 1016 and 1018), these were all sealed by the subsoil (1002). A land drain was identified crossing the trench on a north-west, south-east alignment and a further possible feature was investigated but identified as probable root action.
- 5.2.14 A shallow ditch (1004) crossed the trench on a west - east axis at the southern end. This feature was very ephemeral in plan and contained a single very pale grey silty clay (1005).
- 5.2.15 A second linear gully like feature (1016) crossed the trench on a roughly east - west alignment. This was again very ephemeral in plan and had a single pale silty clay fill (1017).

- 5.2.16 Four possible postholes were identified (1006, 1010 1012 and 1018). These were all ephemeral in plan and very shallow when excavated but did have regular profiles. 1018 truncated gully 1016 on its northern edge and 1014 lay directly against the southern edge of 1016. Otherwise there was no apparent alignment of these features within the trench.
- 5.2.17 A shallow pit or ditch terminus (1008) was identified entering the trench from under the eastern edge. This feature was again very ephemeral and contained a single pale silty clay fill (1009)

Trench 11 (Fig. 5)

- 5.2.18 Two features (1104 and 1105) were identified within this trench. Both these features were sealed by the subsoil (1102). A land drain crossed the trench on a north - west, south - east axis.
- 5.2.19 A possible posthole (1104) was investigated. This feature was very ephemeral but burnt flint and burnt bone was recovered during its excavation.
- 5.2.20 A shallow ditch (1105) crossed the trench on a north - south alignment. This feature contained two fills. An initial slump of blueish grey silty clay (1106) lay against the western edge suggesting the possibility of a bank to this side. A flint was recovered from this material. The ditch then gradually infilled with a very pale silty clay material (1107) from which a further flint was recovered.

Trench 12 (Fig. 5)

- 5.2.21 A single pit or ditch terminus (1204) was identified against the eastern edge of the trench sealed by the subsoil (1202). This feature contained a single fill (1205), a pale blueish grey silty clay.
- 5.2.22 **Trenches 21, 29 and 36 (Figs 6 and 7).**

Trench 21 (Fig. 7)

- 5.2.23 Five postholes (2104, 2106, 2108, 2110 and 2112) were identified at fairly regular intervals on a rough west - east axis along the trench. These postholes were fairly uniform in shape and size and could all be part of the same structure. All these features were sealed by the subsoil (2102) and contained pale greyish fills (2105, 2107, 2109, 2111 and 2113).
- 5.2.24 A hedgeline was identified at the west end of the trench. This could be seen to align with the present spaced placement of trees in this field.
- 5.2.25 A fragment of medieval pottery was recovered from the subsoil 2102.

Trench 29 (Fig. 7)

- 5.2.26 This trench was moved 2.0 m south of its proposed location due to the suspected presence of an electrical service.
- 5.2.27 Two features (2905) and (2906) were identified in this trench. These were both sealed by the subsoil (2902).

- 5.2.28 A ditch (2905) was identified crossing the trench on a west - east alignment. This feature was well defined with steep edges and a flattened V profile. A single blue grey silty clay fill (2904) lay within this feature. A small patch of burnt material was identified in the top of 2904.
- 5.2.29 A posthole (2906) was identified at the southern end of the trench. This feature was similar in size and profile and contained a similar blueish grey fill (2907) to the postholes identified in Trench 21.

Trench 36 (Fig. 7)

- 5.2.30 This trench contained a single ditch (3604) crossing the trench on a north - south alignment. This ditch was well defined with a steep flattened V profile similar to 2905 in Trench 29. This feature contained a single blueish grey silty clay (3605).
- 5.2.31 **Trenches 15 - 17, 23, 25, 27, 40 - 44, 51 and 105 (Figs. 8 - 12)**

Trench 15 (Fig. 9)

- 5.2.32 Four features (1504, 1507, 1509 and 1511) were identified in this trench. All were sealed by the subsoil (1502)
- 5.2.33 A ditch (1504) crossed the western end of the trench on a north - west, south - east alignment. This ditch was well defined with a steep flattened V profile and contained a series of two fills (1505 and 1506). The primary fill (1506) was a brownish grey silty clay and was overlain by the secondary fill (1505) a greyish brown silty clay.
- 5.2.34 The terminus of a slightly curving gully type feature (1511) entered the trench from under its southern edge on a slight north - west, south - east alignment. This feature contained a single pale greyish brown sandy clay (1512).
- 5.2.35 A sub-oval pit (1507) was identified. This had a steep profile and contained a single fill (1508) of pale greyish brown sandy silt.
- 5.2.36 An ephemeral feature (1509) was investigated and tentatively identified as a post hole.

Trench 16 (Fig. 9)

- 5.2.37 Three features (1604, 1606 and 1608) were identified in this trench. All were sealed by the subsoil (1602)
- 5.2.38 A possible pit or ditch terminus (1604) was investigated against the eastern edge of the trench. This feature had steep sides and a flat base and contained a single fill (1605) comprising a very pale greyish silty clay.
- 5.2.39 A short slot (1608) was identified in the centre of the trench. This feature had a steep U profile and contained a single fill (1609) of very pale greyish silty clay.
- 5.2.40 A pit (1606) was investigated. This feature was sub circular with a U profile and contained a single fill (1607) of pale orange/grey silty clay.

Trench 17 (Fig. 9)

- 5.2.41 Three features (1704, 1706 and 1708) were identified in this trench. All were sealed by the subsoil (1702).
- 5.2.42 Two of these features (1704 and 1708) were ditches. Ditch 1704 crossed the trench on a north-east, south-west alignment and ditch 1708 crossed the trench on a north-west, south-east alignment. The orientation of these ditches, proximity and similar size suggest they are one ditch that turns at a right angle just to the south of the trench. Both ditches contained a single fill (1705 and 1709) of pale silty clay.
- 5.2.43 A gully (1706) crossed the trench on a north - south alignment. This contained a single fill (1707) of pale orange brown silty clay.

Trench 23 (Fig. 10)

- 5.2.44 Two features (2304 and 2306) were identified in this trench. Both were sealed by the subsoil (2302).
- 5.2.45 A single possible posthole (2304) was investigated. This was ephemeral in plan but proved to have an even profile on excavation. This feature had a single fill (2305) of pale greyish sandy clay.
- 5.2.46 A possible terminus of a slightly curving gully (2306) entered the trench from under the southern edge. This feature appeared ephemeral in plan but proved to have an even profile on excavation. this feature had a single pale greyish sandy clay fill (2307).

Trench 25 (Fig. 10)

- 5.2.47 Two possible postholes (2505 and 2507) were identified in this trench. both were sealed by the subsoil (2502).
- 5.2.48 Posthole 2505 had a central deeper socket on excavation and contained a single fill (2506) of pale blueish grey silty clay.
- 5.2.49 Posthole 2507 was slightly elongated along its east west axis with a steep flattened V profile and containing a single fill (2506) of pale blueish grey silty clay.

Trench 27 (Fig. 10)

- 5.2.50 This trench contained a single ditch (2706) on a north - south alignment. This feature contained two fills (2704 and 2705). The primary fill (2705) comprised a mottled blueish grey silty clay suggesting a partially waterlogged deposition. A flint was recovered from this material. The final deposition (2704) in the ditch consisted of a pale greyish silty clay which appeared to have formed in a hollow on the western edge of the ditch.

Trench 40 (Fig. 11)

- 5.2.51 Four features (4004, 4006 4008 and 4010) were identified in this trench. All were sealed by the subsoil (4002).

- 5.2.52 A ditch (4010) turned at a right angle from a north - east, south - west orientation to a north - west, south - east alignment within the trench. This ditch contained a single fill (4011) of very weathered pale greyish sandy silt.
- 5.2.53 The terminus of a slightly curving gully (4004) entered the trench from the south at its extreme eastern end. This feature contained a single fill (4005) of pale greyish silty clay.
- 5.2.54 A second narrow gully (4008) crossed the trench on a north - east, south - west alignment. This feature was truncated by a land drain on an opposite alignment. Gully 4008 may join at a right angle with ditch 4010 to the south of the trench. Gully 4008 contained a single fill (4009) of very pale greyish sandy silt.
- 5.2.55 A pit (4006) was investigated at the eastern end of the trench. This feature was very ephemeral and contained a single fill (4007) of greyish silty clay.

Trench 42 (Fig. 11)

- 5.2.56 Three features (4204, 4206 and 4208) were identified in this trench. All were sealed by the subsoil (4202).
- 5.2.57 The terminus of a probable curving gully (4204) entered the trench from under the southern edge. This feature was very ephemeral in plan but on excavation proved to have a steep flattened U profile. A single fill (4205) of very pale greyish silty clay was contained within this feature.
- 5.2.58 A ditch (4206) crossed the trench on a north - east, south - west alignment filled with a pale grey clayey silt (4207) from which a sherd of Late Iron Age pottery was recovered. A posthole (4208) truncated the western edge of ditch 4206 and a land drain truncated on a north west to south east alignment. Posthole 4208 must be later than ditch 4206 but an early date is still posited on the basis of the weathered nature of the fill (4209).

Trench 43 (Fig. 11)

- 5.2.59 Only half the trench was excavated to the natural horizon due to an initial CAT scan indicating the possible presence of an electrical service.
- 5.2.60 Two features (4304) and (4306) were identified in this trench. These features were both sealed by the subsoil (4302)
- 5.2.61 A posthole (4304) was investigated and found to be very ephemeral in nature but with a clear profile on excavation. This feature contained a single fill (4305) of pale greyish clayey silt.
- 5.2.62 A narrow ditch (4306) crossed the trench on a roughly east - west alignment. This feature contained a single fill (4307) of grey clayey silt.

Trench 44 (Fig. 11)

- 5.2.63 This trench contained four features (4404, 4406, 4408 and 4410). these features were all sealed by the subsoil (4402).

- 5.2.64 Three features (4404, 4406 and 4408) were identified as postholes . Posthole 4404 differed from 4406 and 4408 in the paler colouring of its fill (4405), possibly suggesting an earlier date.
- 5.2.65 A gully (4410) crossed the trench on a rough north - west, south - east alignment. this feature had a very pale greyish clayey silt fill (4411).

Trench 41 (Fig. 12)

- 5.2.66 Trench 41 contained three ditches (4103, 4105 and 4108). These were all sealed by the subsoil (4102).
- 5.2.67 Ditches 4103 and 4105 run adjacent to each other on a north - west, south - east alignment. An identical pair (10505) and (10508) continue this alignment into Trench 105. These parallel ditches were not contemporaneous as ditch 4105 could be seen to cut into the fill (4104) of ditch 4103.
- 5.2.68 The third ditch (4108) crossed the trench on a north - west, south - east alignment. The single fill (4109) of this feature was slightly darker than the fills of ditches 4103 and 4105 suggesting that it may be of a later date.

Trench 105 (Fig. 12)

- 5.2.69 Four features (10505, 10508, 10511 and 10513) were identified in this trench. All these features were sealed by the subsoil 10503. A land drain crossed the trench on a north - south alignment.
- 5.2.70 Ditches 10505 and 10508 were immediately adjacent to each other and continued the line of ditches 4103 and 4105 in Trench 41. These ditches probably make a 90 degree turn onto a westerly course just beyond the southern edge of the trench as ditch 10513 was identified as corresponding to 10508. The outer ditch beside 10513 could only be identified in the trench section at this point. Sherds of Late Iron Age to 1st century AD pottery were recovered from fill (10506) in ditch 10505.
- 5.2.71 A possible gully terminus or small pit (10511) entered the trench from under the northern edge. This feature contained a single fill (10512), comprising a pale greyish silty clay.
- 5.2.72 A lower subsoil horizon (10502) was identified underlying subsoil 10503. Ditch 10513 could be seen to be cut from under 10503 and through 10502.

Trench 51 (Fig. 12)

- 5.2.73 Six features (5101, 5108, 5113, 5116, 5119 and 5122) were identified in this trench. A land drain crossed the west end of the trench on a south east to north west alignment.
- 5.2.74 Clay pit 5101 will be discussed later in the section describing post medieval features on the site.
- 5.2.75 A series of subsoil horizons (5106, 5110, 5111, 5112 and 5118) were identified within the trench with features impacting from differing levels.

- 5.2.76 A linear feature (5108) crossed the trench on a south - west, north - east alignment. The very irregular base of this feature suggests it may have been a hedgeline. This feature was overlain by a series of subsoils (5110, 5111, 5112 and 5106.). The horizons 5110, 5111 and 5112 appear to make a slight bank sealing 5108 and may represent the formation of a hedge bank.
- 5.2.77 A linear gully (5113) paralleled hedgeline 5108 on its southern edge but could be seen to impact through the possible overlying bank, being sealed by the upper bank material (5112). This feature contained a single fill (5114) of pale greyish silty clay.
- 5.2.78 A second linear gully (5116) crossed the trench on a south - west, north - east alignment. This gully could be contemporaneous with gully 5113 and is sealed by a lower subsoil (5118) that could be the same as 5112. This feature contained a single fill (5117) of pale grey brown silty clay.
- 5.2.79 A small pit or gully terminus (5119) was investigated against the southern trench edge adjacent to gully 5116. This feature impacted through the lower subsoil 5118 and was sealed by the upper subsoil 5106. A single fill (5121), comprising a pale grey orange mottled sandy silt clay was contained within 5119.
- 5.2.80 A suboval pit (5122) was investigated at the eastern end of the trench. This feature contained a single fill (5123) of pale grey silty clay and was sealed by the lower subsoil 5118.
- 5.2.81 **Trenches 81 - 82, 86 - 87, 93 - 96 100 and 101 (Figs. 13 - 17)**

Trench 81 (Fig. 14)

- 5.2.82 A single feature (8104) was investigated in this trench. The trench also contained five post medieval clay pits (8106, 8110, 8114, 8118 and 8120) and two land drains crossing the trench on a north west to south east alignment.
- 5.2.83 A ditch (8104) crossed the trench on a west-east alignment. This feature was sealed by the subsoil (8102) and had been truncated against the eastern edge of the trench by the excavation of clay pit (8106). Ditch 8104 contained a single fill (8105) of pale grey brown sandy silt. This ditch may correspond to in Trench 82.

Trench 82 (Fig. 14)

- 5.2.84 Ten features (8206, 8208, 8210, 8212, 8214, 8216, 8218, 8220, 8223 and 8225) were investigated within this trench. The trench also contained seven post medieval clay pits (8227, 8229, 8231, 8233, 8235, 8237 and 8239).
- 5.2.85 A parallel pair of gully termini (8206 and 8208) entered the trench on an east - west alignment. These were sealed by the subsoil (8202) and truncated by the excavation of clay pit (8235). The gullies contained identical fills (8207 and 8209) of pale yellow brown silty clay.
- 5.2.86 Two ditches (8210 and 8212) intersected at a right angle within the trench. Ditch 8212 crossed the trench on an east-west alignment and was truncated by ditch 8210 on a north-south alignment. Ditch 8210 terminated at its junction with 8212. These

ditches contained near identical fills (8211 and 8213) of pale yellowish grey silty clay. Both ditches were sealed by the subsoil (8202).

- 5.2.87 A small posthole (8214) was investigated at the northern end of the trench. This feature was sealed by the subsoil (8202) and contained a single fill (8215) of pale yellowish grey clay silt.
- 5.2.88 A pit (8216) and a ditch (8218) were investigated at the northern end of the trench. Pit 8216 truncated the southern edge of ditch 8218. Ditch 8218 crossed the trench on a west south west to east north east alignment. The fills (8217 and 8219) were nearly identical pale grey silty clay.
- 5.2.89 A shallow ditch (8220) crossed the trench on a west-east alignment. This feature was sealed by the subsoil (8202) and truncated by two post medieval clay pits (8229 and 8231). Ditch 8220 contained two fills (8221 and 8222). The primary fill (8221) was a dark grey silty gley suggesting deposition in fairly damp conditions. Above this lay a pale grey brown silty clay (8222).
- 5.2.90 A ditch (8223) crossed the trench to the south and parallel to the two gullies (8206 and 8208). This ditch contained a single fill (8224) of pale grey silty clay into which a stakehole (8225) had been inserted. Ditch 8223 and stakehole 8225 were sealed by the subsoil (8202).

Trench 86 (Fig. 15)

- 5.2.91 Three postholes (8604, 8612 and 8618) were identified in this trench. In addition the trench contained five post medieval clay pits (8606, 8608, 8614, 8620 and 8622).
- 5.2.92 Postholes 8612 and 8618 lay adjacent to each other on a north south alignment. Posthole 8612 was very ephemeral but appeared in plan to be identical in radius to 8618 which contained a fill (8619) comprising pale grey silty clay with some charcoal inclusions and containing a sherd of Prehistoric pottery..
- 5.2.93 Posthole 8604 lay at the eastern edge of the trench and had an even excavated profile containing a single fill (8605) of pale grey silty clay.
- 5.2.94 All three postholes were sealed by the subsoil (8602).

Trench 87 (Fig. 15)

- 5.2.95 Nineteen features (8704, 8706, 8708, 8710, 8712, 8714, 8716, 8718, 8720/28, 8722, 8724, 8726, 8730, 8732 8734, 8736, 8738 8740 and 8742) were investigated in this trench. The trench also contained two land drains crossing on a north west south east alignment and five post medieval clay pits (8744, 8746, 8748, 8750 and 8752). All the features except the clay pits were sealed by the subsoil (8702).
- 5.2.96 Three features (8706, 8714 and 8716) were irregular in plan and had uneven profiles suggesting they may be the result of tree disturbance. All had identical fills (8707, 8715 and 8717) of pale grey silty clay.
- 5.2.97 Four ditches (8710, 8718, 8740 and 8742) crossed the trench on a west-east alignment. Ditch 8742 truncated the southern edge of ditch 8740. The fill (8743) of

ditch 8742 was browner than the pale greyish clay silt (8742) within ditch 8740. The fills (8711, 8719, and 8741) of ditches 8710, 8718 and 8740 were an identical pale grey silty clay.

- 5.2.98 A gully (8720/28) on a north-west, south-east alignment terminated within the trench. The relationship of this feature with ditch 8718 to the north was unclear due to the truncation of both features by clay pit (8748). Gully 8720/28 contained a single fill (8721/29) of orange brown sandy silt.
- 5.2.99 A gully (8730) entered the trench from the west before terminating. This feature contained a single fill (8731) of pale greyish brown sandy silt.
- 5.2.100 Two postholes (8708 and 8712) lay adjacent to the northern edge of ditch 8710 and may represent an associated fence-line. These postholes contained identical fills (8709 and 8713) of pale grey sandy silt.
- 5.2.101 Posthole (8724) lay between ditch 8718 and gully terminal 8720/28. A possible stakehole (8726) lay immediately to the south of posthole 8724. The single fill (8725) in posthole 8724 comprised a pale orange brown sandy silt. Fill (8727) was noticeably darker than 8725.
- 5.2.102 Posthole 8704 was investigated towards the north end of the trench. This feature contained a single fill (8705) of pale grey sandy silt.
- 5.2.103 Two possible postholes (8732 and 8734) were investigated in the centre of the trench. Posthole 8732 was truncated by a clay pit (8750) and posthole 8734 by a land drain. Both these postholes had identical fills (8733 and 8735) of pale grey sandy silt.
- 5.2.104 Two features (8736 and 8738) were investigated either side of the two ditches 8740/42. These features are truncated by the excavation of ditches 8740/42 and may represent the terminal ends of a single short slot. The fills (8737 and 8739) were an identical pale yellowish grey sandy silt.

Trench 93 (Fig. 16)

- 5.2.105 A single ditch (9308) was identified in this trench. The trench also contained four post medieval clay pits (9304, 9306, 9314 and 9316) and a field drain that crossed the trench on a north-west to south-east alignment.
- 5.2.106 Ditch (9308) crossed the trench on an east-west alignment. The ditch was sealed by the subsoil (9302) and was truncated by clay pit (9306). The ditch contained two fills (9309 and 9310). The primary fill (9310), a dark grey silty clay slumped into the ditch from the north suggesting the presence of a bank on this side and deposition in damp conditions. The upper fill (9309) was a pale grey silty clay.

Trench 94 (Fig. 16)

- 5.2.107 Four features (9404, 9406, 9408 and 9412) were investigated in this trench. The clay pit (9408) will be discussed later with the post medieval features on the site. Two land drains crossed the trench on a north-west to south-east alignment.

- 5.2.108 A pit or shallow ditch terminus (9404) entered the eastern end of the trench from the south. This feature was sealed by the subsoil (9402) and contained a single fill (9405) of pale brownish grey sandy silt.
- 5.2.109 A shallow ditch (9406) crossed the trench on a north-north-east, south-south-west alignment. This feature contained a single fill (9407) of pale grey brown sandy silt and was sealed by the subsoil (9402). Sherds of Prehistoric pottery were recovered from 9407.
- 5.2.110 A ditch (9412) crossed the trench on a north-south alignment. This feature was sealed by the subsoil (9402) and contained a single fill (9413), consisting of a pale brownish grey sandy silt.

Trench 95 (Fig. 16)

- 5.2.111 Eight features (9504, 9506, 9508, 9510, 9512, 9514, 9516 and 9518) were investigated in this trench. The trench also contained three post medieval clay pits (9520, 9522 and 9524) and a land drain that crossed the trench on a north west to south east alignment. The land drain truncated clay pit (9524). Two ephemeral pale silt patches were also investigated but classified as natural in origin.
- 5.2.112 A ditch (9504) crossed the trench on a west-east alignment. This feature was sealed by the subsoil (9502) and contained a single fill (9505) comprising a pale greyish brown clayey silt from which sherds of late Iron Age pottery were recovered.
- 5.2.113 Six possible postholes (9506, 9508, 9510, 9512, 9514 and 9516) were identified within the trench. Postholes 9508, 9512 and 9514 appeared to form a line on a north south alignment and may represent a structure. All the postholes had identical fills (9507, 9509, 9511, 9513, 9515 and 9517) of light brownish grey clayey silt and were sealed by the subsoil (9502).
- 5.2.114 An oval pit (9518) aligned north-south was investigated at the southern end of the trench. This feature was sealed by the subsoil (9502) and truncated by a land drain. The single fill (9519) of this feature was a pale brownish grey clayey silt.

Trench 96 (Fig. 16)

- 5.2.115 Six features (9604, 9606, 9610, 9616, 9620 and 9622) were investigated in this trench. The trench also contained five post medieval clay pits (9608, 9612, 9614, 9618 and 9626) and two land drains crossing on a north-west, south-east alignment. Clay pits 9608 and 9626 were both truncated by land drains.
- 5.2.116 A ditch (9604) crossed the trench on a north-south alignment. This feature was truncated by clay pit (9608), a land drain and a posthole (9606). Ditch 9604 was sealed by the subsoil (9602) and contained a single fill (9605) into which posthole (9606) had been inserted.
- 5.2.117 The terminus of a ditch (9610) was investigated against the southern edge of the trench. This ditch appeared to be curving into the trench from the south but was truncated by clay pit (9614) and disturbed by an animal burrow making its exact orientation unclear. Ditch 9610 was sealed by the subsoil (9602) and contained a

single fill (9611) of greyish brown clay silt from which sherds of Late Iron Age to first century pottery were recovered.

5.2.118 Four postholes (9606, 9616, 9620 and 9622) were identified in the trench, all sealed by the subsoil (9602). No discernable pattern was apparent to the postholes though posthole 9616 would have lain against the outside of ditch 9610 if it curves to the south. The relationship of posthole 9616 with ditch 9610 was obscured by the truncation by clay pit 9614. Posthole 9606 lay within the fill (9605) of ditch 9604.

Trench 100 (Fig. 17)

5.2.119 Six features (10004, 10006, 10008, 10010, 10012 and 10014) were investigated in this trench. In addition the trench contained three post medieval clay pits (10016, 10020 and 10022) and two land drains crossing on a north-west, south-east alignment.

5.2.120 All the investigated features were identified as post holes and were sealed by the subsoil (10003). No discernable pattern was apparent to the postholes within the trench though 10004 and 10006 lay adjacent to each other.

Trench 101 (Fig. 17)

5.2.121 Seven features (10105, 10112, 10114, 10116, 10122, 10124 and 10127) were investigated in this trench. In addition the trench contained five Post medieval clay pits (10108, 10118, 10129, 10135 and 10137) and a field drain that crossed on a north west to south east alignment.

5.2.122 Three postholes (10105, 10114 and 10122) formed a north-south alignment along the trench though their relationship is by no means certain as posthole 10114 had a square profile in plan compared to the circular postholes 10105 and 10122. All three postholes were sealed by the subsoil (10102). The fills (10106, 10115, and 10123) of these features were an identical pale grey sandy silt. Posthole 10105 may have had a remnant post pipe represented by a second fill (10107) that was darker grey and contained flecks of charcoal and fragments of daub/burnt clay.

5.2.123 Three ditches (10112, 10124 and 10127) crossed the trench on a west-east alignment. All were sealed by the subsoil (10102).

5.2.124 Ditch 10112 contained a single fill (10113) consisting of a pale grey clayey silt.

5.2.125 Ditch 10124 contained two fills (10125 and 10126). The primary fill (10126) was below the local water table and comprised a dark greyish gley, commensurate with deposition in damp conditions. The secondary fill (10125) was a brownish grey silty clay.

5.2.126 Ditch 10127 contained a single fill (10128) of reddish brown sandy clay silt from which a sherd of medieval pottery was recovered. This ditch was truncated by a land drain.

5.2.127 A probable gully terminus (10116) entered the trench from the east. This feature contained a single fill (10117) of yellowish brown silty clay.

5.2.128 Trenches 46, 48 - 49, 56 - 60, 69 and 67 (Figs. 18 - 22)***Trench 46 (Fig. 19)***

- 5.2.129 Three features (4605, 4507 and 4609) were investigated in this trench. All were sealed by the subsoil (4602). The trench also contained a land drain on a north east south west alignment.
- 5.2.130 A pit (4605) was partially within the eastern side of the trench. This feature had two fills (4604 and 4610). The section of this feature suggests the existence of two features. The fill (4604) representing a later pit. Fill 4604 was an orange brown sandy silt and fill 4610 an orange grey sandy silt.
- 5.2.131 A shallow gully (4607) crossed the trench on a north-west, south-east alignment. This feature contained a single fill (4606) comprising pale grey brown silty clay.
- 5.2.132 A small posthole (4609) was investigated. This feature contained a single fill (4608) of orange grey sandy silt.

Trench 48 (Fig. 19)

- 5.2.133 Eleven features (4805, 4807, 4809, 4811, 4812, 4814, 4818, 4820, 4822, 4824 and 4826) were investigated in this trench. All were sealed by the thin subsoil (4802). The trench also contained a land drain crossing on a north-south alignment that truncated features at the east end of the trench. A sherd of 1st to 4th century AD pottery was recovered from the topsoil (4801).
- 5.2.134 Three substantial postholes (4807, 4809, and 4811) were identified. All had even near vertical edges and a flat base and contained similar fills (4806, 4810 and 4812) of dark brown silty clay. These postholes may have formed part of a curving structure.
- 5.2.135 A ditch (4805) crossed the trench on a north-north-east, south-south-west alignment. This feature contained a single fill (4804) of dark brown sandy silt clay from which quantities of pot sherds of late 1st century AD date were recovered.
- 5.2.136 Adjacent to the east of ditch 4805 was an elongated posthole (4826). This had vertical sides and a flat base and contained a single fill (4827) comprising a pale blueish grey silty clay.
- 5.2.137 Two conjoining postholes (4812 and 4822) were investigated at the eastern end of the trench. Both postholes had a regular profile with vertical sides and a flat base. Posthole 4822 truncated posthole 4812 and both had been truncated by the excavation of a possible shallow ditch terminus (4814) that curved into the trench from the north. The fills (4813 and 4823) of the two postholes were a greyish blue silty clay.
- 5.2.138 The possible ditch terminus (4814) truncated the western edge of a ditch (4818). A possible gully terminus (4824) could be seen to cut into the fill (4815) of 4814. A land drain truncated both 4814 and 4824. The fill (4815) of 4814 was a pale blue grey silty clay.

5.2.139 A pair of ditches (4818 and 4820) crossed the trench on a north-north-west, south-south-east alignment. Ditch 4821 was a later feature and could be seen to truncate the eastern side of ditch 4818. The fill (4821) of ditch 4820 was a grey silty clay containing charcoal flecks and a quantity of late 1st to early 2nd century AD pottery. Ditch 4818 was also truncated to the west by the possible ditch terminus 4814. The fill (4819) of ditch 4818 was a very pale grey silty clay.

Trench 49 (Fig. 19)

5.2.140 Four possible postholes (4905, 4907, 4909 and 4911) were investigated in this trench. All were sealed by the subsoil (4902). There was no apparent pattern to the postholes within the trench. The fills (4904, 4906, 4909 and 4910) were an identical pale grey silty clay.

Trench 56 (Fig. 20)

5.2.141 Three features (5604, 5606 and 5608) were investigated in this trench. All were sealed by the subsoil (5602).

5.2.142 A ditch (5604) crossed the trench on a north-west to south-east alignment. This ditch had a stepped profile and a flat base in which a ceramic land drain rested. The fill (5605) of this ditch was a fairly moist and organic loam. It is likely that this ditch is a fairly modern feature.

5.2.143 An irregular linear feature with uneven edges and base was investigated at the eastern end of the trench. The irregular nature of this feature suggests that it is an old hedgeline. The single fill (5607) was a pale brownish yellow clayey sand silt from which sherds of late Iron Age pottery were recovered.

5.2.144 A single posthole (5608) was identified within the trench. This contained a single fill (5609) of brown clayey sand silt.

Trench 57 (Fig. 20)

5.2.145 Three features (5704, 5708 and 5710) were investigated in this trench. All were sealed by the subsoil (5702) from which a sherd of Late Iron age to first century pottery was recovered. The trench also contained a land drain crossing on a south west to north east alignment.

5.2.146 Two possible postholes were investigated (5708 and 5710). Posthole (5708) had a flattened profile and contained a single fill (5709) of brown clayey sand silt. The second possible posthole (5710) had an irregular profile and was identified as a probable root hollow.

5.2.147 A narrow ditch (5704) crossed the trench on a west - east alignment. This feature contained a single fill (5705) comprising a pale blue grey silty clay from which a quantity of pot sherd of Late Iron age to 1st century AD were recovered.

Trench 58 (Fig. 20)

5.2.148 Six features (5804, 5809, 5811, 5813, 5815 and 5821) were investigated in this trench. The Post medieval clay pit (5821) will be discussed later with the post

medieval features on the site. The trench also contained a further three post medieval clay pits (5807, 5817, and 5819).

5.2.149 Three ditches (5804, 5809 and 5811) were seen to run parallel with each other on a north-west, south-east alignment. Ditches 5809 and 5811 terminated within the trench and lay immediately adjacent to each other. Ditch 5811 could be seen to truncate the southern edge of ditch 5809. Ditch 5809 was further truncated at its terminus by the placement of a posthole (5813). The fills (5810 and 5812) of ditches 5809 and 5811 respectively were a similar grey clayey silt containing sherds of late Iron Age to 1st century AD pottery. The fill (5814) of posthole (5813) was a blue-grey silty clay.

5.2.150 Ditch 5804 was truncated by two post medieval clay pits (5807 and 5819). Two fills (5805 and 5806) were apparent within ditch 5804. The primary fill (5806) was a pale grey clayey silt and appeared to slump from the north east suggesting a bank may have existed to this side. The secondary fill (5805) was an even silting of dark grey clayey silt containing quantities of 1st century AD pottery.

5.2.151 A narrow ditch (5815) crossed the trench on a north-south alignment. This feature contained a single fill (5816) of grey silty clay from which late Iron Age pottery was recovered.

Trench 59 (Fig. 21)

5.2.152 Four features (5908, 5911, 5915 and 5919) were investigated in this trench. Pit (5911) is probably associated with a post medieval clay pit (5913) and will be discussed separately with the post medieval features on the site. A further three post medieval clay pits (5905, 5917 and 5921) were identified in the trench as well as a land drain crossing on a north east to south west alignment. All the features except the clay pits were sealed by the subsoil (5902).

5.2.153 A ditch (5908) crossed the trench on an east - west alignment. This feature contained two fills (5906 and 5907). The primary fill (5907), an orange mottled blue grey silt clay, occupied the north side of the ditch suggesting the ditch had been recut or cleaned out. Late Iron age to 1st century AD pottery was recovered from this material. The secondary fill (5906) was a pale blue-grey silty clay.

5.2.154 The terminal of a possibly curving ditch (5915) entered the trench from under the western edge. This feature contained a single fill (5914) of orange mottled pale grey clayey silt. A clay pit (5921) truncated the southern edge of this feature.

5.2.155 A possible posthole (5919) was identified. This feature had been truncated to the north by a clay pit (5917). Posthole 5919 was fairly ephemeral in plan but proved to be regular on excavation and contained a single fill (5918) of pale grey sandy clay.

Trench 60 (Fig. 21)

5.2.156 Two features (6011 and 6013) were investigated in this trench, both were sealed by the subsoil (6002). In addition the trench contained three post medieval clay pits (6005, 6007 and 6009) and a land drain crossing on a north west to south east axis.

Chalk had been dumped at the eastern end of the trench to stabilise the ground for a gateway between fields.

5.2.157 A ditch (6011) crossed the trench on a north-south alignment. This feature contained a single fill (6010) of dark grey brown silty clay. Modern tile was recovered from this material.

5.2.158 A posthole (6013) was identified containing a single fill (6012) of pale blueish grey clayey sand silt.

Trench 69 (Fig. 21)

5.2.159 Two features (6909 and 6911) were investigated in this trench. The trench also contained two Post medieval clay pits (6905 and 6907).

5.2.160 A possible posthole (6909) was investigated at the northern end of the trench. This feature was very ephemeral and contained a single fill (6908) of pale orange grey clayey silt.

5.2.161 A pit or possible ditch terminus (6911) entered the trench from the east. This feature may have been curving but its orientation was obscured by a truncation by a post medieval clay pit (6905). The pit or ditch terminus (6911) contained a single fill (6910) of pale orange grey clayey silt.

Trench 67 (Fig. 22)

5.2.162 Three features (6705, 6730 and 6732) were investigated in this trench. In addition the trench contained a sequence of ancient subsoil horizons (6711, 6712 and 6734) and six Post medieval clay pits (6702, 6708, 6710, 6724, 6728 and 6743) with associated working surfaces and dumps. The post medieval features and deposits will be discussed later with the post medieval features on the site.

5.2.163 The earliest feature identified in Trench 67 was a ditch (6732) that crossed the trench on an east-west alignment. This feature had been sealed by a mottled orange brown deposit (6712) containing sherds of late Iron Age to first century pottery. The material of 6712 may represent a bank associated with a second ditch (6730) or a build up of alluvium.

5.2.164 Ditch 6732 contained a sequence of fills (6713 - 6720). Fills 6718 - 20 slumped from the south and 6713 from the north suggesting the ditch had been regularly cleaned or re cut. The final deposition (6714) into the ditch was an even silting of orange mottled grey brown sandy silt clay from which sherds of late Iron Age to 1st century AD pottery were recovered.

5.2.165 A second ditch (6730) crossing the trench on an east-west alignment was a later feature as it cut from the same level as the southern edge of the possible bank material (6712). Ditch 6730 contained a single fill (6731) of orange mottled brown sandy silt clay. A thin deposit (6707) of greyish silty clay, containing late Iron Age pottery, lay directly over the southern edge of ditch 6730. This material may represent a build up of alluvium.

- 5.2.166 A single posthole (6705) was identified within the trench containing a single fill (6906) of orange mottled pale grey sandy silt clay. This feature was sealed by the possible bank material (6712).
- 5.2.167 Overlying the possible bank material (6712) and ditch (6730) was a buried subsoil (6711/6734) sealed by a surface (6723) associated with the activity within the post medieval clay pits.
- 5.2.168 **Trenches 108 - 120 (Fig. 23)**
- 5.2.169 Thirteen trenches were excavated along the proposed access road corridor on the west side of the River mole.
- 5.2.170 Trench 113 was placed to bisect a linear feature identified from aerial photography. This feature proved to be a narrow modern ditch containing brick, tile and a ploughshare.
- 5.2.171 Trenches 116, 118 and 119 had archaeological features in them. These comprised a gully (11604) in Trench 116, a gully (11804) in Trench 118 and a gully (11904) and posthole (11906) in Trench 119. Trench 120 had a preserved sequence of alluvial deposits 2.40 m in depth.
- 5.2.172 Gully 11604 in Trench 116 ran on a north-south alignment and contained a single fill (11605) of very pale clayey silt.
- 5.2.173 Gully 11804 in Trench 118 ran on a west-east alignment and contained a single fill (11805) of pale grey silty clay.
- 5.2.174 A short gully (11904), aligned north-south, was investigated in Trench 119. This feature contained a single fill (11905) of pale grey clay silt from which a fragment of fired clay was recovered. This feature had a posthole (11906) inserted into its southern terminus.
- 5.2.175 Trench 120 contained a sequence of alluvial deposits overlying the drift geology (12007) of mixed clay and sands. A sondage was excavated through the alluvial deposits at the west end of the trench. Overlying the natural was a layer of brown alluvial silt (12006) which was sealed by a black peat layer (12005). This in turn was overlain by another alluvial silt (12004) which was sealed by a mixed material of silt with large clay inclusions (12003) which may represent material dredged from the River Mole immediately to the east of the trench. This re-deposited material was overlain by the modern subsoil (12002).

Peat samples
done?

Trench 74 (Fig. 24)

- 5.2.176 Four features (7404, 7408, 7417 and 7420) were identified in this trench. In addition dumped deposits associated with Post medieval ditch cutting and activity in clay pits was identified overlying preserved ancient subsoil horizons. The trench also contained three post medieval clay pits (7430, 7458 and 7460) and a land drain on a north south alignment.

- 5.2.177 A possible ancient bank (7445/7446) was identified crossing the trench on a north-south axis. The material of this bank was heavily leached being a pale yellowish white clayey sand silt (7446) at its base and becoming darker (7445) towards its top. A flint was recovered from 7445. A series of preserved subsoil deposits (7442, 7443, 7444) sealed this bank and the centre of the bank had been impacted by workings associated with activity in post medieval clay pits. (7423, 7424, 7426, 7428)
- 5.2.178 A single posthole (7420) was identified in the trench. This contained a single fill (7421) of orangey sandy clay silt.
- 5.2.179 Two parallel ditches (7404 and 7408) crossed the trench on a north-south alignment. The materials excavated from these ditches were probably represented in a sequence of dumped deposits (7431-7436 and 7438-7441) overlying preserved subsoils (7437, 7442 and 7447) on the rising ground to the west of the ditches.
- 5.2.180 Ditch 7404 contained a sequence of waterlogged deposits (7407, 7422 and 7452-7455). The ditch was not fully excavated as large worked structural timbers and degraded wood were identified in 7422 and below. The limit of excavation was marked prior to backfilling. The upper limit of continuous water-logging was marked by a thin layer of iron pan (7455). Above this the ditch had gradually filled in (7405 and 7406).
- 5.2.181 Ditch 7408 was also waterlogged in its base with an organic deposit present (7413). Above this the ditch was apparently only periodically waterlogged with gleyey deposits (7412 and 7415). There is evidence that the ditch may have been cleared out with a remnant fill (7416) not fully removed against the east edge. The ditch finally gradually silted up (7410 and 7411) before a shallow re cut was excavated (7417) which itself silted (7409 and 7414). Finally a field drain (7418) was inserted into the eastern edge of the re cut (7417).
- 5.2.182 The latest activity in the trench appears to be associated with the excavation and subsequent use of the clay pits (7430, 7458 and 7460). Dumped materials (7423-7428), probably associated with the clay pits overlie the dumps probably associated with the cutting of ditches 7404 and 7408. It is possible that the dumps from clay pits and ditches are intermingled.

Post medieval Clay Pits (Fig. 25)

- 5.2.183 Trenching in the area to the south of an approximate line running from Trenches 57 through 50, 51 and 53 through to 74 revealed 193 pits of varying size containing clay. From the number of pits in the trenches it can be posited that there are approximately 4800 of these pits across the southern half of the site.
- 5.2.184 All of the pits observed penetrated into the topsoil and generally appeared to have clay forming a hump over the rim of the containing pit.
- 5.2.185 A number of Trenches (51, 67 and 74) demonstrated there to be working surfaces and dumps within the upper subsoil associated with the pits. Further activity was recognised within the edges and in some cases centre of pits suggesting extraction of clay leaving voids that then infilled.

- 5.2.186 Three of the smaller examples of these pits were hand excavated (5101 in Trench 51, 5821 in Trench 58 and 9408 in Trench 94). Two of the larger examples (9114 in Trench 94 and 9208 in Trench 92) were machined to their full depth.
- 5.2.187 Excavation of pits 5101 and 5821 were abandoned at the limit of safe working depth. Both these pits had vertical upper edges with a pronounced bell shape becoming apparent as they penetrated into the underlying Wealden Clay. Both these pits had been backfilled by Wealden Clay, with silt lenses (5103-5104) in pit 5101 suggesting periodical extraction and refilling.
- 5.2.188 Pit 9408 was excavated to its full depth which did not impact the underlying Wealden Clay. This pit had vertical sides and a flat base and had been backfilled with Wealden Clay (9409). Layers of Wealden Clay contaminated by subsoil (9410 and 9411) in the top of the pit again indicated some working and replacement of clay within the pit.
- 5.2.189 The machined pits (9114 and 9208) both penetrated the underlying Wealden Clay and had vertical upper edges and rounded bases. Both were backfilled with Wealden Clay (9115 and 9209). Pit 9114 had a vertical sided slot (9112) around its northern edge backfilled with subsoil (9113) indicative of the clay having been extracted.
- 5.2.190 Where the Wealden Clay was visible it was observed to contain quantities of a shaley clay mineral. In Trenches 67 and 74 this mineral had been removed from the clay and dumped (6723 and 7426).

5.3 Finds

Prehistoric and Roman Pottery

By Dan Stansbie

Introduction

- 5.3.1 The assemblage was recorded using the standard OA recording system for Roman and late Iron Age pottery (Booth 2004). A table listing all dated pottery sherds is given in Appendix 2.
- 5.3.2 An assemblage of 649 sherds of pottery weighing 5240 g was recovered from the evaluation. The assemblage was dominated by pottery dating from the late Iron Age and Roman periods, with some Prehistoric (P), medieval (Z20) and post-medieval (Z30) sherds also present.
- 5.3.3 Grog tempered wares (E80), organic and grog tempered wares (E13), flint tempered wares (E60) and shell tempered wares (E40) made a significant contribution to the group. Forms in these fabrics included: necked jars, carinated jars, bead rimmed jars, narrow mouthed jars and globular jars. These forms typically date to the late Iron age and Roman periods.
- 5.3.4 Sandy grey wares (R20), medium/fine grey wares (R30) and black surfaced wares (R50) made up the rest of the Roman coarse wares. In these fabrics necked jars with everted rims and high shoulders predominated and bead-rimmed and globular jars were not present. There was also a straight sided platter.
- 5.3.5 Regional or imported wares were scarce but included a single sherd of Verulamium white ware (W21); a sherd of North Gaulish fine sandy white ware (W32) and several sherds of miscellaneous colour coated ware (F).
- 5.3.6 No forms were present in the fine wares, however the fabrics date to the first and second centuries AD.
- 5.3.7 Although the surfaces of some sherds were abraded (probably due to poor soil conditions) the assemblage contained reasonably large sherds, suggesting a low level of disturbance and indicating that the focus of occupation was close by.

Flint*By Rebecca Devaney (OA)*

5.3.8 A total of 78 pieces of worked flint were recovered from the evaluation at Horley (Table 1). The material was spread between 46 contexts, excluding the unstratified, with most contexts containing three or less pieces of flint; however, contexts 602, 4804 and 6712 produced eight, six and ten pieces respectively. A further four fragments (4 g) of burnt unworked flint were retrieved from four contexts (Table 2). The flint can be broadly dated to the later Prehistoric period on technological grounds. Exceptions are the bladelet core which is likely to be Mesolithic in date and possibly some of the carefully worked blades.

Table 1. Summary of Worked Flint

Category	Context				Total
	602	480 4	671 2	Other contexts	
Flake	6	2	6	29	43
Blade	1			7	8
Blade-like flake			1	1	2
Chip	1				1
Rejuvenation flake		1			1
Irregular waste		2	1	13	16
Multiplatform flake core			1	1	2
Single platform flake core				1	1
Bladelet core		1			1
Unclassifiable core			1	1	2
Retouched blade				1	1
Total	8	6	10	54	78

Table 2. Summary of Burnt Unworked Flint by Context

Context	Count	Weight (g)
602	1	1
3202	1	1
6712	1	0
6711	1	2
Total	4	4

5.3.9 The flint was catalogued according to a broad debitage, core or tool type. Information about burning and breaks was recorded and where identifiable raw material and technological characteristics were also noted. In addition, cores were weighed and burnt unworked flint was quantified by count and weight. The data was entered into an MS Access database.

5.3.10 Where identifiable, most of the raw material is gravel flint. The cortex is generally thin and abraded. It is likely that the material is locally derived, perhaps coming from river gravel deposits. There are also six pieces of chalk flint. These can be identified by their thick, white, chalky cortex. The nearest source of this material is just over 10

km away. The flint appears to be of a reasonable knapping quality as few thermal flaws were noted.

- 5.3.11 The condition of the worked flint is varied. A total of 22 pieces are in a fresh condition, whereas 36, 12 and four pieces show slight, moderate and heavy post-depositional damage respectively. The damage is most frequently seen on vulnerable unretouched edges and implies the occurrence of post-depositional disturbance across the site. Surface alteration is limited with just 17 pieces showing cortication. A total of 20 pieces are broken and nine are burnt.
- 5.3.12 Unretouched debitage dominates the assemblage with 71 pieces (*Table 1*). In general, the material is technologically poor. There are few clearly defined striking platforms and platform edge abrasion was not seen on any of the material. The flint is therefore consistent with a later Prehistoric date. Possible exceptions to this are a couple of blades. They have well defined platforms and negative blade scars, which suggests they are products of a more careful knapping industry and may be residual from an earlier period.
- 5.3.13 In general the cores are small and irregularly worked. The multi-platform flake cores have a range of removals, both in size and shape. Hinged terminations are seen on both pieces. The single platform flake core has flake, blade-like flake and blade removals. During its use the core broke along a thermal flaw and truncated a previous negative scar. However, the core was not discarded and continued to be worked. The bladelet core has parallel removals taken from one side. The final two removals have hinge terminations which led to the core being discarded. Chronologically the bladelet core is likely to be Mesolithic in date. The two unclassifiable cores are very irregular and minimally worked. Excluding the bladelet core, the cores are chronologically undiagnostic, but are consistent with a later Prehistoric date. The small size of the cores, and consequently the negative removals, is not consistent with the larger debitage seen in the assemblage. It is possible that knapping took place elsewhere.
- 5.3.14 The only tool in the assemblage is a retouched blade. It has direct retouch along its left edge and both proximal and distal breaks. It is characteristically similar to the unretouched blades.
- 5.3.15 The flint from Horley can be broadly dated to the later Prehistoric period. This date is based on the poor technological characteristics of the assemblage. A couple of pieces appear to be residual from an earlier phase, including a bladelet core dated to the Mesolithic and a couple of nicely worked blades. The material is thinly spread between the contexts with just three clusters and suggests low-density background activity.

Metalwork

By Leigh Allen (OA) Coins by Paul Booth (OA)

- 5.3.16 A total of 5 metal objects were recovered from the archaeological investigation at Horley NW development. The most notable is a silver coin of Cunobelinus. An irregular shaped fragment of copper alloy sheet may be a fragment from a second coin but no distinguishing marks are visible. The 3 iron objects are all nails of different forms. With the exception of the silver coin the condition of the assemblage is poor, the copper alloy sheet is very worn and the iron is corroded and concreted.
- 5.3.17 The most notable object is the silver coin of Cunobelinus (Silver unit of Cunobelinus (as Hobbs 1996.1898) *obv*: Cross of plain lines and pellet rings in corners 'C', 'V', 'N', 'O'. *rev*: Capricorn facing right below 'CVNO', pellet border.)
- 5.3.18 Although the coin came from an unstratified context it has the potential to give information on dating, trade and status of the settlement.
- 5.3.19 The copper alloy sheet fragment if it proves to be a coin will help to date the context (5602) as no other finds appear to come from that feature.
- 5.3.20 The nails were recovered from an Iron Age posthole (10107), the cut of an Early Roman ditch (4804) and the fill of a post medieval ditch (6010).

Miscellaneous Finds

By Leigh Allen (OA)

- 5.3.21 A total of 3 clay pipe fragments were recovered from post medieval contexts. Two of these fragments from contexts 7452 and 7908 are short sections of stem only, the third fragment from context 701 has a fragment of the spur at the base of the bowl attached to the stem.
- 5.3.22 Two fragments of vessel glass were recovered from a post medieval context. A fragment from the base of a green glass bottle and the rim and neck from a light green, thin walled vessel. was recovered from the fill of post medieval ditch (6010).
- 5.3.23 A total of 31 fragments (673g) of ceramic building material were recovered from post medieval contexts. The majority of the material comprises plain fragments of roofing tile with the exception of a larger/thicker fragment from context 7606 which is a fragment of floor tile.
- 5.3.24 A total 132g of slag were recovered from context 4804 an Early Roman ditch. The slag will need to be seen by a specialist to identify the process.
- 5.3.25 Fragments of burnt stone were recovered from prehistoric contexts 8619 (fill of posthole 8618), 4106 (fill of ditch 4105) and 6714 (fill of double-ditch 6732). Unworked fragments were recovered from contexts 6711 (post Roman buried soil)

and 4804 (an early Roman ditch cut). The lithology of these fragments will need identifying by a specialist.

- 5.3.26 A single piece of worked wood was recovered from context 7422 the fill of post medieval ditch 7404. The object will need to be seen by a wood specialist.

5.4 **Palaeo-Environmental Remains**

- nothing from T. 120, so guess
no peats done then.

Palaeo-Environmental Assessment

By Dana Challinor and Laila Sikking (OA)

- 5.4.1 Samples were taken during the evaluation from several locations for the recovery of charred plant remains. Eight samples were processed; the bulk samples by flotation using a modified Siraf-type machine, with the flot collected on a 250µm mesh. The smaller samples for waterlogged remains and snails were floated by hand. After air-drying the flots were scanned for material under a binocular microscope at x10 and x20 magnification.
- 5.4.2 The flots of the samples processed for charred remains (Table 3) varied in size but were similar in character. The preservation of the material was quite poor and the flots were contaminated with modern roots and seeds. Wood charcoal was abundant with a mix of taxa present, including *Quercus* sp. (oak) in all samples. In general, the charcoal was heavily infused with sediment. Sample 6 (context 10107) and sample 29 (context 6711) contained species from the Maloideae family (apple, pear, hawthorn) and sample 32 (context 6712) contained *Salix*-type (willow type) charcoal. In the largest flot (sample 17, context 6714) *Fraxinus excelsior* (ash) was present in large amounts. Two samples produced single grains of cereals (cf. *Triticum*, wheat) but no chaff was evident. Some weed seeds were present in sample 6 and sample 7 (context 10115).
- 5.4.3 The single sample processed for waterlogged remains (sample 11, context 7422) was medium in size, with an abundance of wood fragments and herbaceous material. Seeds were not common, although a couple of species, including cf. *Echium* sp. (Viper's-bugloss) were noted. Stem fragments and insect remains were also present. The snail sample (sample 14, context 7445) produced no snails and there were none noted in any of the samples processed.
- 5.4.4 The assessed samples offer limited potential to provide useful economic or environmental information about this site. The most abundant material, wood charcoal, could provide some information about fuel use in the Iron Age, but the poor preservation would make identification difficult. It is clear from the range of taxa in sample 6 that the assemblage does not relate directly to the structure. It is recommended that no further analytical work on these samples is required.
- 5.4.5 These samples indicate that charred and waterlogged plant remains are preserved, albeit poorly, on this site. Future excavations should include a targeted sampling strategy focussing on deposits most likely to produce good assemblages (e.g. hearths,

pits, waterholes). Deposits should also be well sealed to minimise the potential for modern contamination. The lack of snails from any of the samples suggests that the soil conditions may be quite acidic. Consequently, some provision should be made for taking pollen samples, which may be better preserved in these conditions, particularly since there are waterlogged deposits on the site.

Sample no.	Context	Type of context	Period	Amount of charcoal	Charcoal identification	Grain
1	8619	posthole	Iron Age	++++	mostly oak	cf. <i>Triticum</i>
6	10107	posthole	Iron Age	+++	mixed taxa, mostly oak and some Maloideae	
7	10115	posthole	Iron Age	++	mostly oak	
17	6714	boundary ditch	Iron Age	++++	mixed taxa, <i>Fraxinus excelsior</i> and oak	cf. <i>Triticum</i>
29	6711	buried soil	Iron Age/ Roman	++	mixed taxa, mostly oak and some Maloideae	
32	6712	buried soil	Iron Age/ Roman	++	mixed taxa, mostly oak and some <i>Salix</i> -type	

+ = present (up to 5 items), ++ = frequent (5-25), +++ = common (25-100), ++++ = abundant (>100)

Table 3: The results of the assessment of samples with charred remains.

6 DISCUSSION AND INTERPRETATION

6.1 Reliability of Field Investigation

- 6.1.1 The field evaluation encountered a fairly uniform natural overlain by a relatively thin subsoil that had not been disturbed by deep ploughing. The horizon between subsoil and natural drift deposits was fairly diffuse with features difficult to discern within the subsoil. The trenches were machined to the natural for clarity and some truncation of archaeological deposits will have occurred. Many of the features identified were ephemeral in nature and required excavation to prove them to be archaeological or natural features.
- 6.1.2 Overall the spatial distribution of trenches aided in qualifying this site as having a relatively high density of archaeology with a concentration to the south and west of the area to the east of the River Mole. The results of the evaluation are considered to be reliable and provide a good representation of the archaeological potential of this site.

6.2 Overall Interpretation

- 6.2.1 The natural drift deposits encountered within the trial trenches was uniformly intensely iron panned suggesting an acidic environment is prevalent on the site. No bone was recovered from any of the trenches which confirmed that preservation of bone and other organic material will be poor except possibly in anaerobic waterlogged deposits.
- 6.2.2 The pottery and flint assemblage recovered generally demonstrated a minimum of post-depositional wear suggesting that the site has not been extensively deep ploughed and that archaeological features and deposits will be well preserved. This was confirmed by the identification of stratified subsoil horizons in Trenches 67 and 74.
- 6.2.3 The five areas of archaeological potential identified and the area to the west of the River Mole will be discussed in turn. This will be followed by a summary of the prehistoric and Roman evidence of the site.
- 6.2.4 Finally the evidence for post medieval utilisation of the site will be discussed.
- 6.2.5 *Trenches 3, 5 - 6 and 10 - 11 (Figs. 3 - 5)*
- 6.2.6 Features in this area were generally difficult to discern with pale leached fills. Ditches and gullies were identified in all five trenches with a cluster of possible postholes in Trench 10.
- 6.2.7 None of the ditches identified appeared to be present in multiple trenches but were generally orientated either east-west or north-south.

- 6.2.8 The cultural material recovered from this area was scarce and dominated by flints. The flints were generally characterised as being technologically later Prehistoric in date. The few incidences of possible earlier prehistoric flint can be ascribed to ^{What?}
- 6.2.9 No finds or deposits were present to indicate any significant domestic utilisation of this area.
- 6.2.10 Generally this area can be envisaged as being part of a field system on the periphery of a later prehistoric settlement.
- 6.2.11 *Trenches 21, 29 and 36 (Figs. 6 - 7)*
- 6.2.12 This area has been highlighted due to the presence of five postholes in alignment within Trench 21. A further posthole of similar character was identified in Trench 29. The two ditches identified again conformed to either a north-south or east-west orientation.
- 6.2.13 Features in this area were easier to discern with darker fills than those noted above.
- 6.2.14 Artefactual evidence from these trenches was scarce and again there was no indicator of significant domestic activity. The presence of a posthole alignment within a trench is however significant and suggests a structural element is to be found in this area.
- 6.2.15 *Trenches 15 - 17, 23, 25, 27, 40 - 44, 51 and 105 (Figs. 8 - 12)*
- 6.2.16 This area was characterised by a series of ditches and gullies. Ditches forming the corners of possible enclosures were identified in Trenches 17 and 40 and in the area of Trenches 41, 51 and 105. The terminals of possibly curving gullies were identified in Trenches 15, 23, 40 and 42.
- 6.2.17 Ditches in this area did not uniformly conform to a north-south and east-west orientation suggesting a sequence of land use is present in the area.
- 6.2.18 The presence of possible curving gullies may suggest the presence of ring gullies indicative of domestic settlement activity or stock enclosures within the area.
- 6.2.19 Artefactual evidence was again sparse in this area and was again mostly characterised by flints that could be broadly ascribed a late prehistoric date on technological grounds. Pottery of late Iron Age to 1st century AD was recovered from two trenches (42 and 105) to the south of the area.
- 6.2.20 Generally this area can be characterised as being a superimposed sequence of field systems with a possible encroachment of domestic settlement of late Iron Age or early Roman date from the south.
- 6.2.21 *Trenches 81 - 82, 86 - 87, 93 - 96, 100 and 101 (Figs. 13 - 17)*
- 6.2.22 Features in this area were generally ephemeral as a result of the leached silty drift geology.

- 6.2.23 The area is characterised by an intense concentration of ditches, gullies, shallow pits and possible postholes indicative of settlement activity. Features were clearly seen to be stratified within Trenches 82 and 86 suggesting a prolonged utilisation of the area.
- 6.2.24 The ditches identified generally confirmed to a north - south or east - west orientation. A ditch could be identified as passing west - east between trenches 81 and 82. A number of possibly curving gullies were identified in Trenches 82, 87 and 94. Postholes were identified in Trenches 82, 86, 87, 94, 100 and 101.
- 6.2.25 Artefactual evidence was sparse and was characterised by Late Iron Age to 1st century Roman pottery. This is indicative of some form of domestic activity being present within the area.
- 6.2.26 Generally this area could be characterised as being a part of a Late Iron age to early Roman settlement with structures encompassed by ditches and gullies.
- 6.2.27 *Trenches 46, 48 - 49, 56 - 60, 69 and 67. (Figs. 18 - 22)*
- 6.2.28 Features in this area were generally fairly well defined with dark brownish fills. Stratification of subsoil deposits and features was identified in Trench 67.
- 6.2.29 This area was characterised by ditches orientated north-west , south-east and north-east, south-west with postholes in Trench 48.
- 6.2.30 A significant assemblage of pottery of Late Iron Age to 1st century Roman date was recovered from trenches 48, 58 and 67. The assemblage included a small selection of regional and imported wares including a sherd of Verulamium white ware (W21), a sherd of North Gaulish fine sandy white ware (W32) and several sherds of miscellaneous colour coated ware (F).
- 6.2.31 A silver unit of *Cunobelinus* was recovered by metal detector from the topsoil north of Trench 65. Several iron nails and fragments of slag were recovered from Trench 48. The silver unit is possibly indicative of a moderate status being ascribed to the settlement. The presence of slag suggests the possibility of some form of industrial process being present in the vicinity.
- 6.2.32 The presence of relatively unabraded pottery and postholes is indicative of domestic activity being present in the vicinity. The presence of a silver unit and a small selection of regional or imported wares is suggestive of a settlement of moderate importance.
- 6.2.33 The area can generally be characterised as being a domestic occupation of Late pre Roman Iron Age to first century Roman date.
- 6.2.34 *Trench 74 (Fig. 24)*
- 6.2.35 A single feature tentatively identified as a later prehistoric bank was identified in this trench suggesting a partition of landscape.
- 6.2.36 *Prehistoric and Roman Summary*

- 6.2.37 Overall the main focus of activity can be located to the south of the area east of the River Mole. This comprises settlement evidence of late Iron Age to first century Roman date possibly with an intensification in the first century. Significant settlement appears to have been abandoned by the early second century until the excavation of the clay pits in the Post medieval period.
- 6.2.38 The presence of a silver unit of Cunobelinus, imported or regional pottery, slag and iron nails this area suggests a settlement of moderate wealth and status may be present.
- 6.2.39 To the north of this focus is a superimposed system of field enclosures. Pottery recovered from north-west, south-east and north-east, south-west ditches suggests that the system laid out on this orientation has been imposed over an earlier system orientated north-south, west-east from which the sparse flint evidence suggests a late prehistoric date.
- 6.2.40 A number of flint blade fragments that can tentatively be ascribed an earlier prehistoric date were recovered from Trenches 6 and 11 to the north of the area.
- 6.2.41 On morphological grounds it can be surmised that ephemeral features with heavily leached fills are generally earlier in date. The majority of features of probable Roman date were easier to define prior to excavation with darker material within them similar to the local subsoil.
- 6.2.42 Simple stratification of later prehistoric to late Iron Age features can be expected in the area of Trenches 15 - 17, 23, 25, 27, 40 - 44, 51 and 105.
- 6.2.43 Complex stratification of features of mainly Late Iron Age and early Roman date can be expected in the area of Trenches 81 - 82, 86 - 87, 93 - 96, 100 and 101.
- 6.2.44 Stratification of later Prehistoric to late pre Roman and first century Roman subsoil deposits and features can be expected in the area of Trenches 46, 48 - 49, 56 - 60, 69 and 67.
- 6.2.45 Features and deposits in the southern half of the area will be heavily impacted upon by Post medieval clay pits and associated working surfaces and hollows.
- 6.2.46 *Medieval and Post medieval Features (Figs. 26 - 27)*
- 6.2.47 Virtually no evidence was encountered in the trenches to suggest significant activity on the site from the second century through to the post medieval period.
- 6.2.48 A total of 193 pits backfilled with Wealden Clay were identified in trenches across the southern half of the area east of the River Mole. It is feasible that approximately 4800 of these pits could exist in this area.
- 6.2.49 Surfaces and deposits associated with these clay pits were recognised in Trenches 67 and 74 sealing preserved archaic subsoils. The clay pits generally had fills that humped up into the topsoil.

- 6.2.50 The clay pits were of varying size and form suggesting a difference in general utility was present. Two larger pits were machined to their full depth into the underlying Wealden Clay. It is posited that the larger examples were quarry pits to extract Wealden Clay and that examples of all sizes were utilised to store clay.
- 6.2.51 Hollows were identified in the edges and centres of numerous of the pits indicating a continued extraction and re filling process was occurring. Evidence for purification of the clay was noted in Trenches 67 and 74 where the shaley clay mineral appeared to have been removed and discarded.
- 6.2.52 Virtually no dating evidence was recovered from the pits but fragments of clay pipe point to a post medieval date. A number of the pits were cut by land drains. Local sources suggest the land drains were excavated by prisoners of war during the Napoleonic Wars. If this is the case, the significant industry represented by these pits may have concluded by the early 19th century.
- 6.2.53 A pair of post medieval ditches were identified in Trench 74 running parallel to Meath Green Lane. Both contained waterlogged deposits and 7404 contained significant quantities of worked wood that may have come from a structure or machinery.
- 6.2.54 No road surface was identified to suggest Meath Green Lane has migrated eastwards and the ditches lie just to the east of a discernable terrace in the land surface that runs parallel to Meath Green Lane. A square pond is present on the same alignment in the grounds of Meath Green Farm to the north and it is possible the ditches once connected with this.
- 6.2.55 The ditches could not be closely dated beyond the post medieval period but may have gone out of use prior to the construction of the present buildings of Meath Green Farm that lie across their projected course immediately to the north. It is possible these ditches may be connected to the industry represented by the clay pits.

APPENDICES

APPENDIX 1 ARCHAEOLOGICAL CONTEXT INVENTORY

<i>Context</i>	<i>Type</i>	<i>Width (m)</i>	<i>Depth (m)</i>	<i>Comments</i>	<i>Finds</i>	<i>Date</i>

2702	Layer		0.30 - 0.60	Yellow/Brown silty Clay Subsoil		
2703	Layer		0.60	Orange/Brown Silty clay with Fe pan Natural		
2704	Fill	0.90	0.60 - 0.74	Fill of 2706		
2705	Fill	1.80	0.60 - 1.00	Fill of 2706 Gleyey		
2706	Cut	2.00	0.60 - 1.00	Ditch		
Trench 28						
2801	Layer		0 - 0.32	Topsoil		
2802	Layer		0.32 - 0.50	Yellow/Brown Silty Clay Subsoil		
2803	Layer		0.50	Orange/Brown Silty Clay with Fe pan Natural		
2804	Fill	0.28	0.32 - 1.00	Fill of 2805		Early C.19th
2805	Cut	0.28	0.32 - 1.00	Field Drain?		Early C. 19th
2806	Fill	0.35	0.50 - 0.70	Fill of 2807		
2807	Cut	0.35	0.50 - 0.70	Ditch?		
Trench 29						
2901	Layer		0 - 0.22	Topsoil		
2902	Layer		0.22 - 0.42	Yellow/Brown Silty Clay Subsoil		
2903	Layer		0.42	Orange/Brown Silty Clay with Fe pan Natural		
2904	Fill	0.95	0.42 - 0.87	Fill of 2905 Gleyey		
2905	Cut	0.95	0.42 - 0.87	Ditch		
2906	Cut	0.33 dia	0.42 - 0.63	Posthole		
2907	Fill	0.33 dia	0.42 - 0.63	Fill of 2906		
Trench 30						
3001	Layer		0 - 0.28	Topsoil		
3002	Layer		0.28 - 0.50	Yellow/Brown Silty Clay Subsoil		
3303	Layer		0.50	Yellow/Brown Silty Clay Natural		
Trench 31						
3101	Layer		0 - 0.60	Topsoil		
3102	Layer		0.60 - 0.70	Brown Sandy Silt Subsoil		

3103	Layer		0.70	White/Orange Brown Sandy Silt Natural		
3104	Cut	0.81 x 0.40	0.70 - 1.05	Pit		
3105	Fill	0.50	0.70 - 1.05	Fill of 3104		
3106	Fill	0.81 x 0.40	0.70 - 0.90	Fill of 3104		
3107	Cut	0.19 x 0.16	0.70 - 0.97	Stakehole?		
3108	Fill	0.10	0.82 - 0.97	Fill of 3107		
3109	Fill	0.19 x 0.16	0.70 - 0.82	Fill of 3107		
Trench 32						
3201	Layer		0 - 0.28	Topsoil		
3202	Layer		0.28 - 0.64	Orange/Brown Sandy Silt Clay Subsoil		
3203	Layer		0.64	White/Orange Brown Silty Clay with Fe pan Natural		
Trench 33						
3301	Layer		0 - 0.50	Topsoil		
3302	Layer		0.50 - 0.60	Brown Sandy Silt Subsoil		
3303	Layer		0.60	Orange/Brown Silty Sand with Fe pan Natural		
3304	Cut	0.50	0.60 - 0.80	Ditch		
3305	Fill	0.50	0.60 - 0.80	Fill of 3304		
3306	Cut	0.36 x 0.15	0.60 - 0.90	Stakehole?		
3307	Fill	0.10	0.74 - 0.90	Fill of 3306		
3308	Fill	0.36 x 0.15	0.60 - 0.74	Fill of 3306		
3309	Cut	1.20	0.60 - 0.80	Ditch		
3310	Fill	1.20	0.60 - 0.80	Fill of 3309		
Trench 34						
3401	Layer		0 - 0.40	Topsoil		
3402	Layer		0.40 - 0.80	Orange/Brown Silty Clay Subsoil		
3403	Layer		0.80	White/Orange Brown Silty Clay with Fe pan Natural		
Trench 35						
3501	Layer		0 - 0.30	Topsoil		
3502	Layer		0.30 - 0.70	Orange/Brown Silty Clay Subsoil		

3503	Layer		0.70	White/Brown silty Clay with reddish mottle and Fe pan Natural		
Trench 36						
3601	Layer		0 - 0.16	Topsoil		
3602	Layer		0.16 - 0.38	Yellow/Brown Silty Clay with reddish mottle Subsoil		
3603	Layer		0.38	Orange/Brown Silty Clay with Fe pan Natural		
3604	Cut	0.90	0.38 - 0.98	Ditch		
3605	Fill	0.90	0.38 - 0.98	Fill of 3604		
Trench 37						
3701	Layer		0 - 0.36	Topsoil		
3702	Layer		0.36 - 0.50	Yellow/Brown Silty Clay Subsoil		
3703	Layer		0.50	Orange/Brown Silty Clay		
3704	Cut	0.44 dia	0.50 - 0.56	Tree Bowl?		
3705	Fill	0.44 dia	0.50 - 0.56	Fill of 3704		
Trench 38						
3801	Layer		0 - 0.40	Topsoil		
3802	Layer		0.40 - 0.54	Yellow/Brown Silty clay with reddish mottle Subsoil		
3803	Layer		0.54	Orange/Grey Silty Clay with Fe pan Natural		
Trench 39						
3901	Layer		0 - 0.28	Topsoil		
3902	Layer		0.28 - 0.40	Yellow/Brown Sandy Clay Silt Subsoil		
3903	Layer		0.40	Brown/Orange Sandy Clay with Fe pan Natural		
Trench 40						
4001	Layer		0 - 0.40	Topsoil		
4002	Layer		0.40 - 0.50	Brown Silty Clay Subsoil		
4003	Layer		0.50	White/Orange Brown Sandy Silt with Fe pan Natural		

4004	Cut	0.46	0.50 - 0.71	Ditch		
4005	Fill	0.46	0.50 - 0.71	Fill of 4005		
4006	Cut	1.04 x 0.46	0.50 - 0.60	Pit		
4007	Fill	1.04 x 0.46	0.50 - 0.60	Fill of 4006		
4008	Cut	0.21	0.50 - 0.62	Ditch		
4009	Fill	0.21	0.50 - 0.62	Fill of 4008		
4010	Cut	0.77	0.50 - 0.71	Ditch		
4011	Fill	0.77	0.50 - 0.71	Fill of 4010		
Trench 41						
4101	Layer		0 - 0.34	Topsoil		
4102	Layer		0.34 - 0.60	Yellow/Brown Silty Clay Subsoil		
4103	Cut	0.64	0.60 - 0.77	Ditch		
4104	Fill	0.64	0.60 - 0.77	Fill of 4103		
4105	Cut	0.88	0.60 - 0.87	Ditch		
4106	Fill	0.88	0.60 - 0.87	Fill of 4105		
4107	Layer		0.60	Grey/Yellow Silty Clay with reddish mottle and Fe pan Natural		
4108	Cut	0.60	0.60 - 0.74	Ditch		
4109	Fill	0.60	0.60 - 0.74	Fill of 4108		
Trench 42						
4201	Layer		0 - 0.24	Topsoil		
4202	Layer		0.24 - 0.44	Yellow/Brown Silty Clay Subsoil		
4203	Layer		0.44	Grey/Orange Clayey Silt with Fe pan Natural		
4204	Cut	1.70 x 0.60	0.44 - 0.98	Pit		
4205	Fill	1.70 x 0.60	0.44 - 0.98	Fill of 4204		
4206	Cut	0.80	0.44 - 0.88	Ditch		Late Iron Age - C. 1st
4207	Fill	0.80	0.44 - 0.88	Fill of 4206	Pottery	Late Iron Age - C. 1st
4208	Cut	0.55 x 0.50	0.44 - 0.90	Posthole		
4209	Fill	0.55 x 0.50	0.44 - 0.90	Fill of 4208		
Trench 43						
4301	Layer		0 - 0.24	Topsoil		
4302	Layer		0.24 - 0.48	Yellow/Brown Silty Clay Subsoil		
4303	Layer		0.48	Grey/Orange Clayey Silt with reddish mottle and Fe pan Natural		
4304	Cut	0.66 x 0.55	0.48 - 0.68	Pit		
4305	Fill	0.66 x 0.55	0.48 - 0.68	Fill of 4304		
4306	Cut	0.50	0.48 - 0.68	Ditch		

4307	Fill	0.50	0.48 - 0.68	Fill of 4306		
Trench 44						
4401	Layer		0 - 0.24	Topsoil		
4402	Layer		0.24 - 0.40	Brown Clayey silt with reddish mottle Subsoil		
4403	Layer		0.40	Grey/Yellow silty Clay with Fe pan Natural		
4404	Cut	0.50 x 0.45	0.40 - 0.58	Pit?		
4405	Fill	0.50 x 0.45	0.40 - 0.58	Fill of 4404		
4406	Cut	1.0 x 0.95	0.40 - 0.60	Pit?		
4407	Fill	1.0 x 0.95	0.40 - 0.60	Fill of 4406		
4408	Cut	0.50 x 0.45	0.40 - 0.62	Pit?		
4409	Fill	0.50 x 0.45	0.40 - 0.62	Fill of 4408		
4410	Cut	0.55	0.40 - 0.62	Ditch		
4411	Fill	0.55	0.40 - 0.62	Fill of 4410		
Trench 45						
4501	Layer		0 - 0.20	Topsoil		
4502	Layer		0.20 - 0.40	Yellow/Brown Silty Clay Subsoil		
4503	Layer		0.40	Orange/Brown Sandy Clay silt with Fe pan Natural		
Trench 46						
4601	Layer		0 - 0.50	Topsoil		
4602	Layer		0.50 - 0.66	Yellow/Brown Silty Clay Subsoil		

4603	Layer		0.66	Orange/Brown Silty Clay with Fe pan Natural		
4604	Fill	1.50 x 0.70	0.66 - 1.01	Fill of 4605		
4605	Cut	3.30 x 1.35	0.66 - 1.16	Pit?		
4606	Fill	0.35	0.66 - 0.74	Fill of 4607		
4607	Cut	0.35	0.66 - 0.74	Gully		
4608	Fill	0.35 x 0.25	0.66 - 0.70	Fill of 4609		
4609	Cut	0.35 x 0.25	0.66 - 0.70	Posthole?		
4610	Fill	2.20 x 1.20	0.66 - 1.16	Fill of 4605		
Trench 47						
4701	Layer		0 - 0.34	Topsoil		
4702	Layer		0.34 - 0.60	Yellow Brown Clayey Sand Silt Subsoil		
4703	Layer		0.60	Orange/Brown Silty Clay with Fe pan Natural		
4704	Fill	0.90 x 0.70	0.60 - 0.85	Fill of 4705		
4705	Cut	0.90 x 0.70	0.60 - 0.85	Pit?		
Trench 48						
4801	Layer		0 - 0.34	Topsoil	C. 1st - 4th pottery	
4802	Layer		0.34 - 0.40	Brown/Grey Clayey Sand Silt Subsoil		
4803	Layer		0.40	Orange/Brown Silty Clay with Fe pan Natural		
4804	Cut	1.20	0.40 - 0.62	Ditch		Late C. 1st (Roman)
4805	Fill	1.20	0.40 - 0.62	Fill of 4804	pottery	Late C. 1st (Roman)
4806	Fill	0.75 dia	0.40 - 0.58	Fill of 4807		
4807	Cut	0.75 dia	0.40 - 0.58	Posthole		
4808	Fill	0.70 dia	0.40 - 0.58	Fill of 4809		
4809	Cut	0.70 dia	0.40 - 0.58	Posthole		
4810	Fill	0.65 dia	0.40 - 0.50	Fill of 4811		
4811	Cut	0.65 dia	0.40 - 0.50	Posthole		
4812	Cut	0.47 dia	0.60 - 0.77	Posthole		
4813	Fill	0.47 dia	0.60 - 0.77	Fill of 4812		
4814	Cut	1.00 x 0.40	0.40 - 0.60	Pit?		
4815	Fill	1.00 x 0.40	0.40 - 0.60	Fill of 4814		
4816	Cut	0.20	0.34 - 1.19	Field Drain		Early C. 19th
4817	Fill	0.20	0.34 - 1.19	Fill of 4816		Early C. 19th
4818	Cut	0.90	0.40 - 0.60	Ditch		Late C. 1st - Early C. 2nd (Roman)

4819	Fill	.0.90	0.40 - 0.60	Fill of 4818	pottery	Late C. 1st - Early C. 2nd (Roman)
4820	Cut	0.50	0.40 - 0.60	Ditch		Late C. 1st - Early C. 2nd (Roman)
4821	Fill	0.50	0.40 - 0.60	Fill of 4820	pottery	Late C. 1st - Early C. 2nd (Roman)
4822	Cut	0.40 dia	0.60 - 0.88	Posthole		
4823	Fill	0.40 dia	0.60 - 0.88	Fill of 4822		
4824	Cut	0.20 dia	0.40 - 0.60	Posthole		
4825	Fill	0.20 dia	0.40 - 0.60	Fill of 4824		
4826	Cut	0.75 x 0.35	0.40 - 1.00	Posthole?		
4827	Fill	0.75 x 0.35	0.40 - 1.00	Fill of 4826		
Trench 49						
4901	Layer		0 - 0.40	Topsoil		
4902	Layer		0.40 - 0.60	Red/Brown Silty Clay with Fe pan Subsoil		
4903	Layer		0.60	Orange/Brown Silty Clay with Fe pan Natural		
4904	Fill	0.50 x 0.30	0.60 - 0.70	Fill of 4905		
4905	Cut	0.50 x 0.30	0.60 - 0.70	Posthole?		
4906	Fill	0.50 dia	0.60 - 0.70	Fill of 4907		
4907	Cut	0.50 dia	0.60 - 0.70	Posthole		
4908	Fill	0.30 dia	0.60 - 0.72	Fill of 4909		
4909	Cut	0.30 dia	0.60 - 0.72	Posthole		
4910	Fill	0.45 x 0.20	0.60 - 0.72	Fill of 4911		
4911	Cut	0.45 x 0.20	0.60 - 0.72	Posthole?		
Trench 50						
5001	Layer		0 - 0.40	Topsoil		
5002	Layer		0.40 - 0.80	Orange/Brown silty Clay Subsoil		
5003	Layer		0.80	White/Orange Brown Silty Clay with Fe pan Natural		
5004	Fill	1.50	0.40	Fill of 5005 Unexcavated		C. 17 - 18th?
5005	Cut	1.50	0.40	Clay Pit Unexcavated		C. 17th - 18th?
5006	Fill	1.50	0.40	Fill of 5007 Unexcavated		C. 17th - 18th?
5007	Cut	1.50	0.40	Clay Pit Unexcavated		C. 17th - 18th?
5008	Fill	3.00 x 2.00	0.40	Fill of 5009 Unexcavated		C. 17th - 18th?
5009	Cut	3.00 x 2.00	0.40	Clay Pit Unexcavated		C. 17th - 18th?

5010	Fill	1.50	0.40	Fill of 5011 Unexcavated		C. 17th - 18th?
5011	Cut	1.50	0.40	Clay Pit Unexcavated		C. 17th - 18th?
Trench 51						
5101	Cut	2.50	0.30 - 1.60	Clay Pit Partially Hand Excavated		C. 17th - 18th?
5102	Fill	2.50	0.30 - 1.60	Fill of 5101 Partially hand excavated		C. 17th - 18th?
5103	Fill	0.30	0.80 - 1.40	Fill of 5101		C. 17th - 18th?
5104	Fill	0.60	0.80 - 1.30	Fill of 5101	abraded medieval pottery	C. 17th - 18th?
5105	Fill	0.40	1.30 - 1.45	Fill of 5101		C. 17th - 18th ?
5106	Layer		0.22 - 0.60	Orange/Brown sandy clay silt Subsoil		
5107	Layer		0 - 0.22	Topsoil		
5108	Cut	1.00	0.90 - 1.20	Hedgeline?		
5109	Fill	1.00	0.90 - 1.20	Fill of 5108		
5110	Layer		0.70 - 0.90	Buried Soil?		
5111	Layer		0.60 - 0.70	Buried Soil?		
5112	Layer		0.50 - 0.60	Buried soil?		
5113	Cut	0.50	0.60 - 0.75	Ditch		
5114	Fill	0.50	0.60 - 0.75	Fill of 5113		
5115	Layer		0.60	Orange/Brown Silty Clay with Fe pan Natural		
5116	Cut	0.50	0.60 - 0.74	Ditch		
5117	Fill	0.50	0.60 - 0.74	Fill of 5116		
5118	Layer		0.50 - 0.80	Buried Subsoil?		
5119	Cut	0.70 x 0.30	0.40 - 0.80	Pit		
5120	Fill	0.70 x 0.30	0.40 - 0.60	Fill of 5119		
5121	Fill	0.70 x 0.30	0.60 - 0.80	Fill of 5119		
5122	Cut	1.10 x 0.50	0.60 - 0.67	Pit?		
5123	Fill	1.10 x 0.50	0.60 - 0.67	Fill of 5122		
Trench 52						
5201	Layer		0 - 0.30	Topsoil		
5202	Layer		0.30 - 0.60	Orange/Brown sandy silt Clay Subsoil		
5203	Layer		0.60	Yellow/Brown Sandy Clay with Fe pan Natural		
5204	Cut	1.50	0.30	Clay Pit Unexcavated		C. 17th - 18th?
5205	Fill	1.50	0.30	Fill of 5204 Unexcavated		C. 17th - 18th?
5206	Cut	1.75	0.30	Clay Pit Unexcavated		C. 17th - 18th?

5207	Fill	1.75	0.30	Fill of 5206 Unexcavated		C. 17th - 18th?
5208	Cut	2.50	0.40	Working Hollow for 5206 Unexcavated		C. 17th - 18th?
5209	Fill	2.50	0.40	Fill of 5208 Unexcavated		C. 17th - 18th?
5210	Cut	0.45	0.60 - 0.71	Ditch		
5211	Fill	0.45	0.60 - 0.71	Fill of 5210		
5212	Cut	0.95 x 0.40	0.60	Ephemeral Pit?		
Trench 53						
5301	Layer		0 - 0.20	Topsoil		
5302	Layer		0.20 - 0.40	Brown Silty Sandy Clay Subsoil		
5303	Layer		0.40	Yellow/Grey sandy clay with Fe pan Natural		
5304	Cut	1.75	0.20	Clay Pit Unexcavated		C. 17th - 18th?
5305	Fill	1.75	0.20	Fill of 5304		C. 17th - 18th?
5306	Cut	1.00	0.20	Clay Pit Unexcavated		C. 17th - 18th?
5307	Fill	1.00	0.20	Fill of 5306 Unexcavated		C. 17th - 18th?
5308	Cut	2.00	0.20	Clay Pit Unexcavated		C. 17th - 18th?
5309	Fill	2.00	0.20	Fill of 5308 Unexcavated		C. 17th - 18th?
5310	Cut	1.00	0.20	Clay Pit Unexcavated		C. 17th - 18th?
5311	Fill	1.00	0.20	Fill of 5310 Unexcavated		C. 17th - 18th?
Trench 54						
5401	Layer		0 - 0.30	Topsoil		
5402	Layer		0.30 - 0.40	Brown Clay Silt with Fe pan Subsoil		
5403	Layer		0.40	Grey/Orange Clayey Silt with Fe pan Natural		
Trench 55 (Unexcavated)						
Trench 56						
5601	Layer		0 - 0.30	Topsoil		
5602	Layer		0.30 - 0.40	Orange Brown Clayey Sand Silt Subsoil		

5603	Layer		0.40	Orange Brown Silty Clay with Fe pan Natural		
5604	Cut	2.45	0.40 - 1.05	Ditch		
5605	Fill	2.45	0.40 - 1.05	Fill of 5604		
5606	Cut	1.80	0.40 - 0.60	Hedgeline?		Late Iron Age
5607	Fill	1.80	0.40 - 0.60	Fill of 5606	pottery	Late Iron Age
5608	Cut	0.60 dia	0.40 - 0.55	Posthole?		
5609	Fill	0.60 dia	0.40 - 0.55	Fill of 5608		
Trench 57						
5701	Layer		0 - 0.30	Topsoil		
5702	Layer		0.30 - 0.40	Brown/Yellow Clayey Sand Silt Subsoil	Late Iron Age - C. 1st pottery	
5703	Layer		0.40	Grey/Orange Silty Clay with Fe pan Natural		
5704	Cut	0.90	0.40 - 0.62	Ditch		Late Iron Age - C. 1st
5705	Fill	0.90	0.40 - 0.62	Fill of 5704	pottery	Late Iron Age - C. 1st
5706	Cut			Field Drain		Early C. 19th?
5707	Fill			Field Drain		Early C. 19th?
5708	Cut	0.50 dia	0.40 - 0.58	Posthole		
5709	Fill	0.50 dia	0.40 - 0.58	Fill of 5708		
Trench 58						
5801	Layer		0 - 0.30	Topsoil		
5802	Layer		0.30 - 0.52	Brown Clayey Silt with Fe pan Subsoil		
5803	Layer		0.52	Grey/Yellow Clayey Silt with Fe pan Natural		
5804	Cut	0.95	0.52 - 0.92	Ditch		C. 1st (Late Iron Age/Early Roman)
5805	Fill	0.80	0.52 - 0.75	Fill of 5804	pottery	C. 1st (Late Iron Age/Early Roman)
5806	Fill	0.80	0.52 - 0.92	Fill of 5804		Late IA/Early Roman?
5807	Cut	3.50 x 1.50	0.30	Clay Pit Unexcavated		C. 17th - 18th?
5808	Fill	3.50 x 1.50	0.30	Fill of 5807 Unexcavated		C. 17th - 18th?
5809	Cut	0.30	0.52 - 0.80	Ditch		Late Iron Age - C. 1st

5810	Fill	0.30	0.52 - 0.80	Fill of 5809	pottery	Late Iron Age - C. 1st
5811	Cut	0.75	0.52 - 0.87	Ditch		Late Iron Age - C. 1st
5812	Fill	0.75	0.52 - 0.87	Fill of 5811	pottery	Late Iron Age - C. 1st
5813	Cut	0.80 x 0.65	0.30	Clay Pit Unexcavated		C. 17th - 18th?
5814	Fill	0.80 x 0.65	0.30	Fill of 5813 Unexcavated		C. 17th - 18th?

10209	Fill	0.25	0.34	Fill of 10208 Unexcavated		C. 17th - 18th?
10210	Cut	1.25	0.34	Clay Pit Unexcavated		C. 17th - 18th?
10211	Fill	1.25	0.34	Fill of 10210 Unexcavated		C. 17th - 18th?
Trench 103						
10301	Layer		0 - 0.26	Topsoil		
10302	Layer		0.26 - 0.40	Orange Brown Clay Silt Subsoil		
10303	Layer		0.40	Orange and Yellow Brown Clay Silt with Clay lensing and Fe pan Natural		
10304	Cut	2.25 x 0.98	0.40 - 0.57	Pit		
10305	Fill	2.25 x 0.98	0.40 - 0.57	Fill of 10304		
Trench 104						
10401	Layer		0 - 0.30	Topsoil		
10402	Layer		0.30 - 0.40	Brown Clayey Silt Subsoil		
10403	Layer		0.40	Yellow Brown Sandy Silt with Clay lensing and Fe pan Natural		
10404	Cut	0.92	0.40 - 0.56	Hedgeline?		?
10405	Fill	0.92	0.40 - 0.56	Fill of 10404		?
Trench 105						
10501	Layer		0.54	Brown White Silty Clay with Fe pan Natural		
10502	Layer		0.44 - 0.54	Lower Subsoil/Buried Soil?		
10503	Layer		0.34 - 0.44	Yellow Brown Clayey Silt Subsoil		
10504	Layer		0 - 0.34	Topsoil		
10505	Cut	0.80	0.44 - 0.79	Ditch Same as 10513?		Late Iron Age

10506	Fill	0.80	0.44 - 0.69	Fill of 10505	pottery	Late Iron Age
10507	Fill	0.60	0.69 - 0.79	Fill of 10506		Late Iron Age
10508	Cut	0.70	0.44 - 0.68	Ditch		Late Iron Age
10509	Fill	0.60	0.60 - 0.68	Fill of 10508		Late Iron Age
10510	Fill	0.70	0.44 - 0.60	Fill of 10508		Late Iron Age
10511	Cut	0.80 x 0.20	0.44 - 0.53	Pit?		
10512	Fill	0.80 x 0.20	0.44 - 0.53	Fill of 10511		
10513	Cut	2.00	0.44 - 0.90	Ditch Same as 10505?		Late Iron Age
10514	Fill	0.70	0.80 - 0.90	Fill of 10513		Late Iron Age
10515	Fill	1.40	0.60 - 0.80	Fill of 10513		Late Iron Age
10516	Fill	2.00	0.44 - 0.60	Fill of 10513		Late Iron Age
Trench 106						
10601	Layer		0 - 0.24	Topsoil		
10602	Layer		0.24 - 0.56	Brown Clayey Sand Silt Subsoil		
10603	Layer		0.56	Yellow/Grey Sandy Clay with Fe pan Natural		
10604	Cut	3.00	0.24	Clay Pit Unexcavated		C. 17th - 18th?
10605	Fill	3.00	0.24	Fill of 10604 Unexcavated		C. 17th - 18th?
10606	Cut?	0.30 x 0.25	0.56 - 0.57	Ephemeral		
10607	Cut?	1.30 x 0.80	0.56 - 0.57	Ephemeral		
Trench 107						
10701	Layer		0 - 0.34	Topsoil		
10702	Layer		0.38 - 0.60	Brown Clayey Sand Silt Subsoil		
10703	Layer		0.60	Yellow/Grey Sandy Clay with Clay lensing and Fe pan Natural		
10704	Cut	3.00	0.34	Clay Pit Unexcavated		C. 17th - 18th?

APPENDIX 4 SUMMARY OF SITE DETAILS

Site Name: Horley Western Development, Phase 1, Horley, Surrey

Site Code: HODEV 04

Grid Reference: TQ 265 447

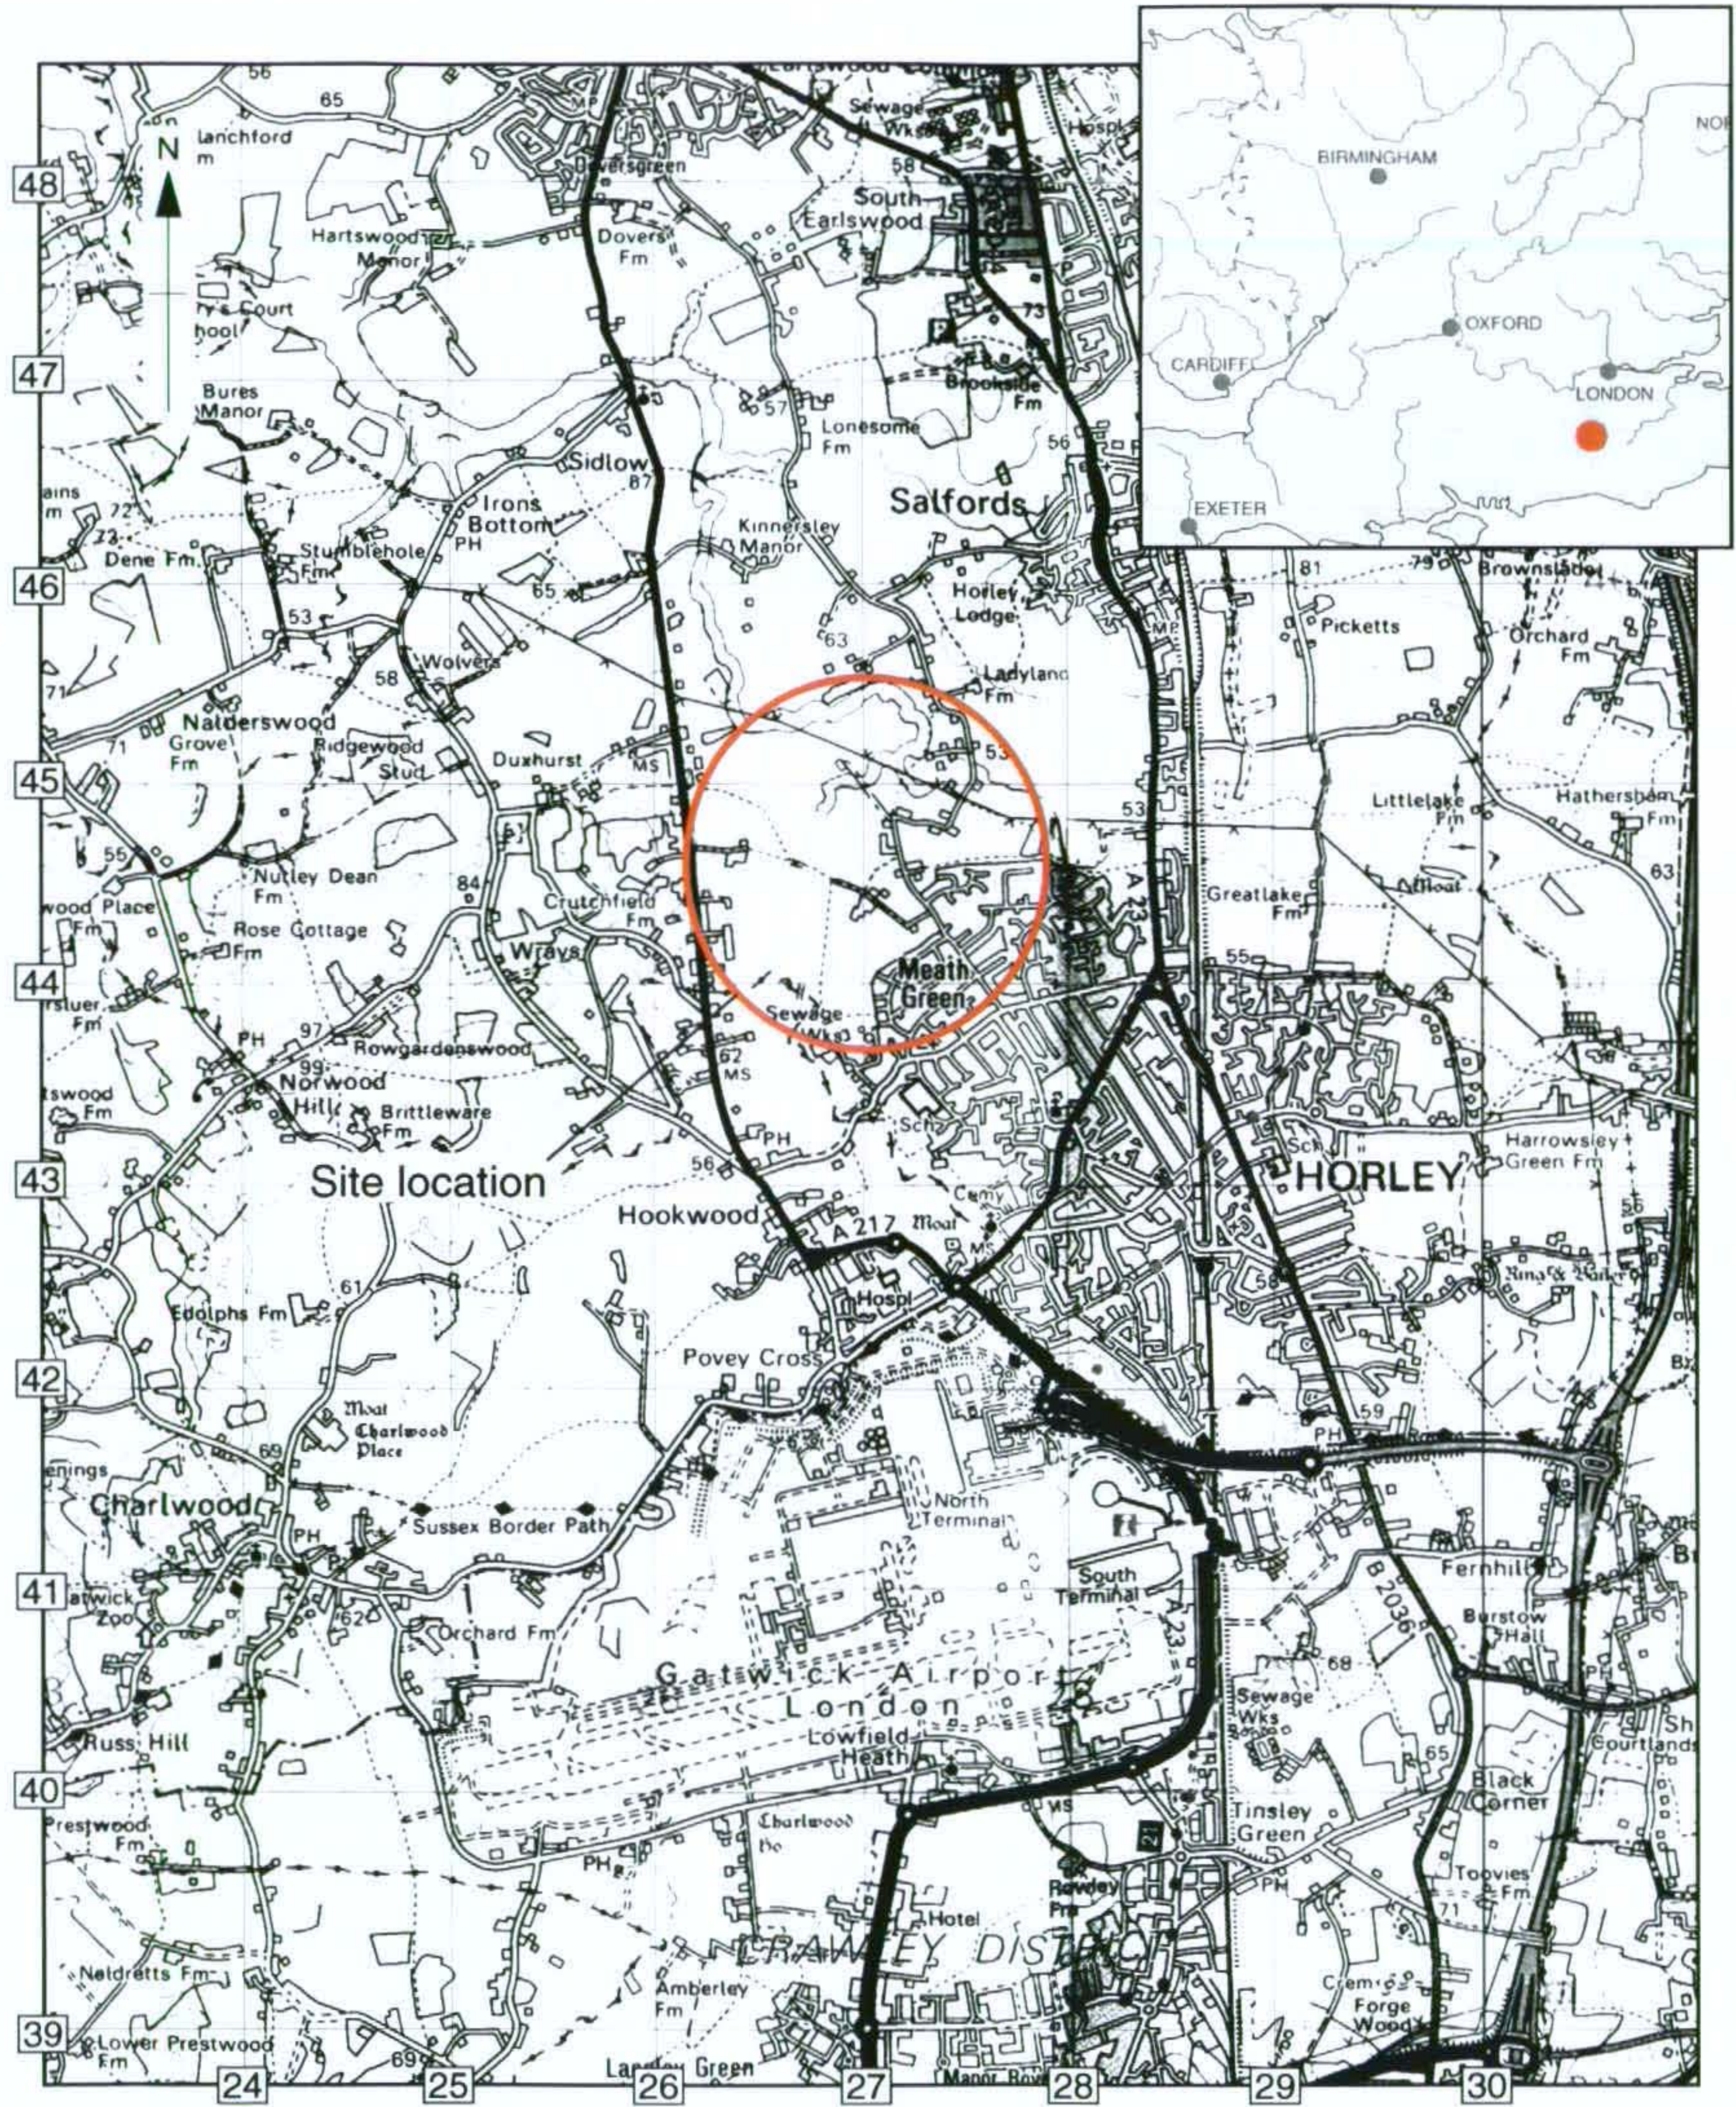

Type of Evaluation: Trial trenching

Date and Duration of Project: May-June 2004 five weeks, July 2004 one week.

Area of Site: 125 hectares.

Summary of Results: Late Iron Age-Roman settlement features and associated field system. A significant number of post medieval pits.

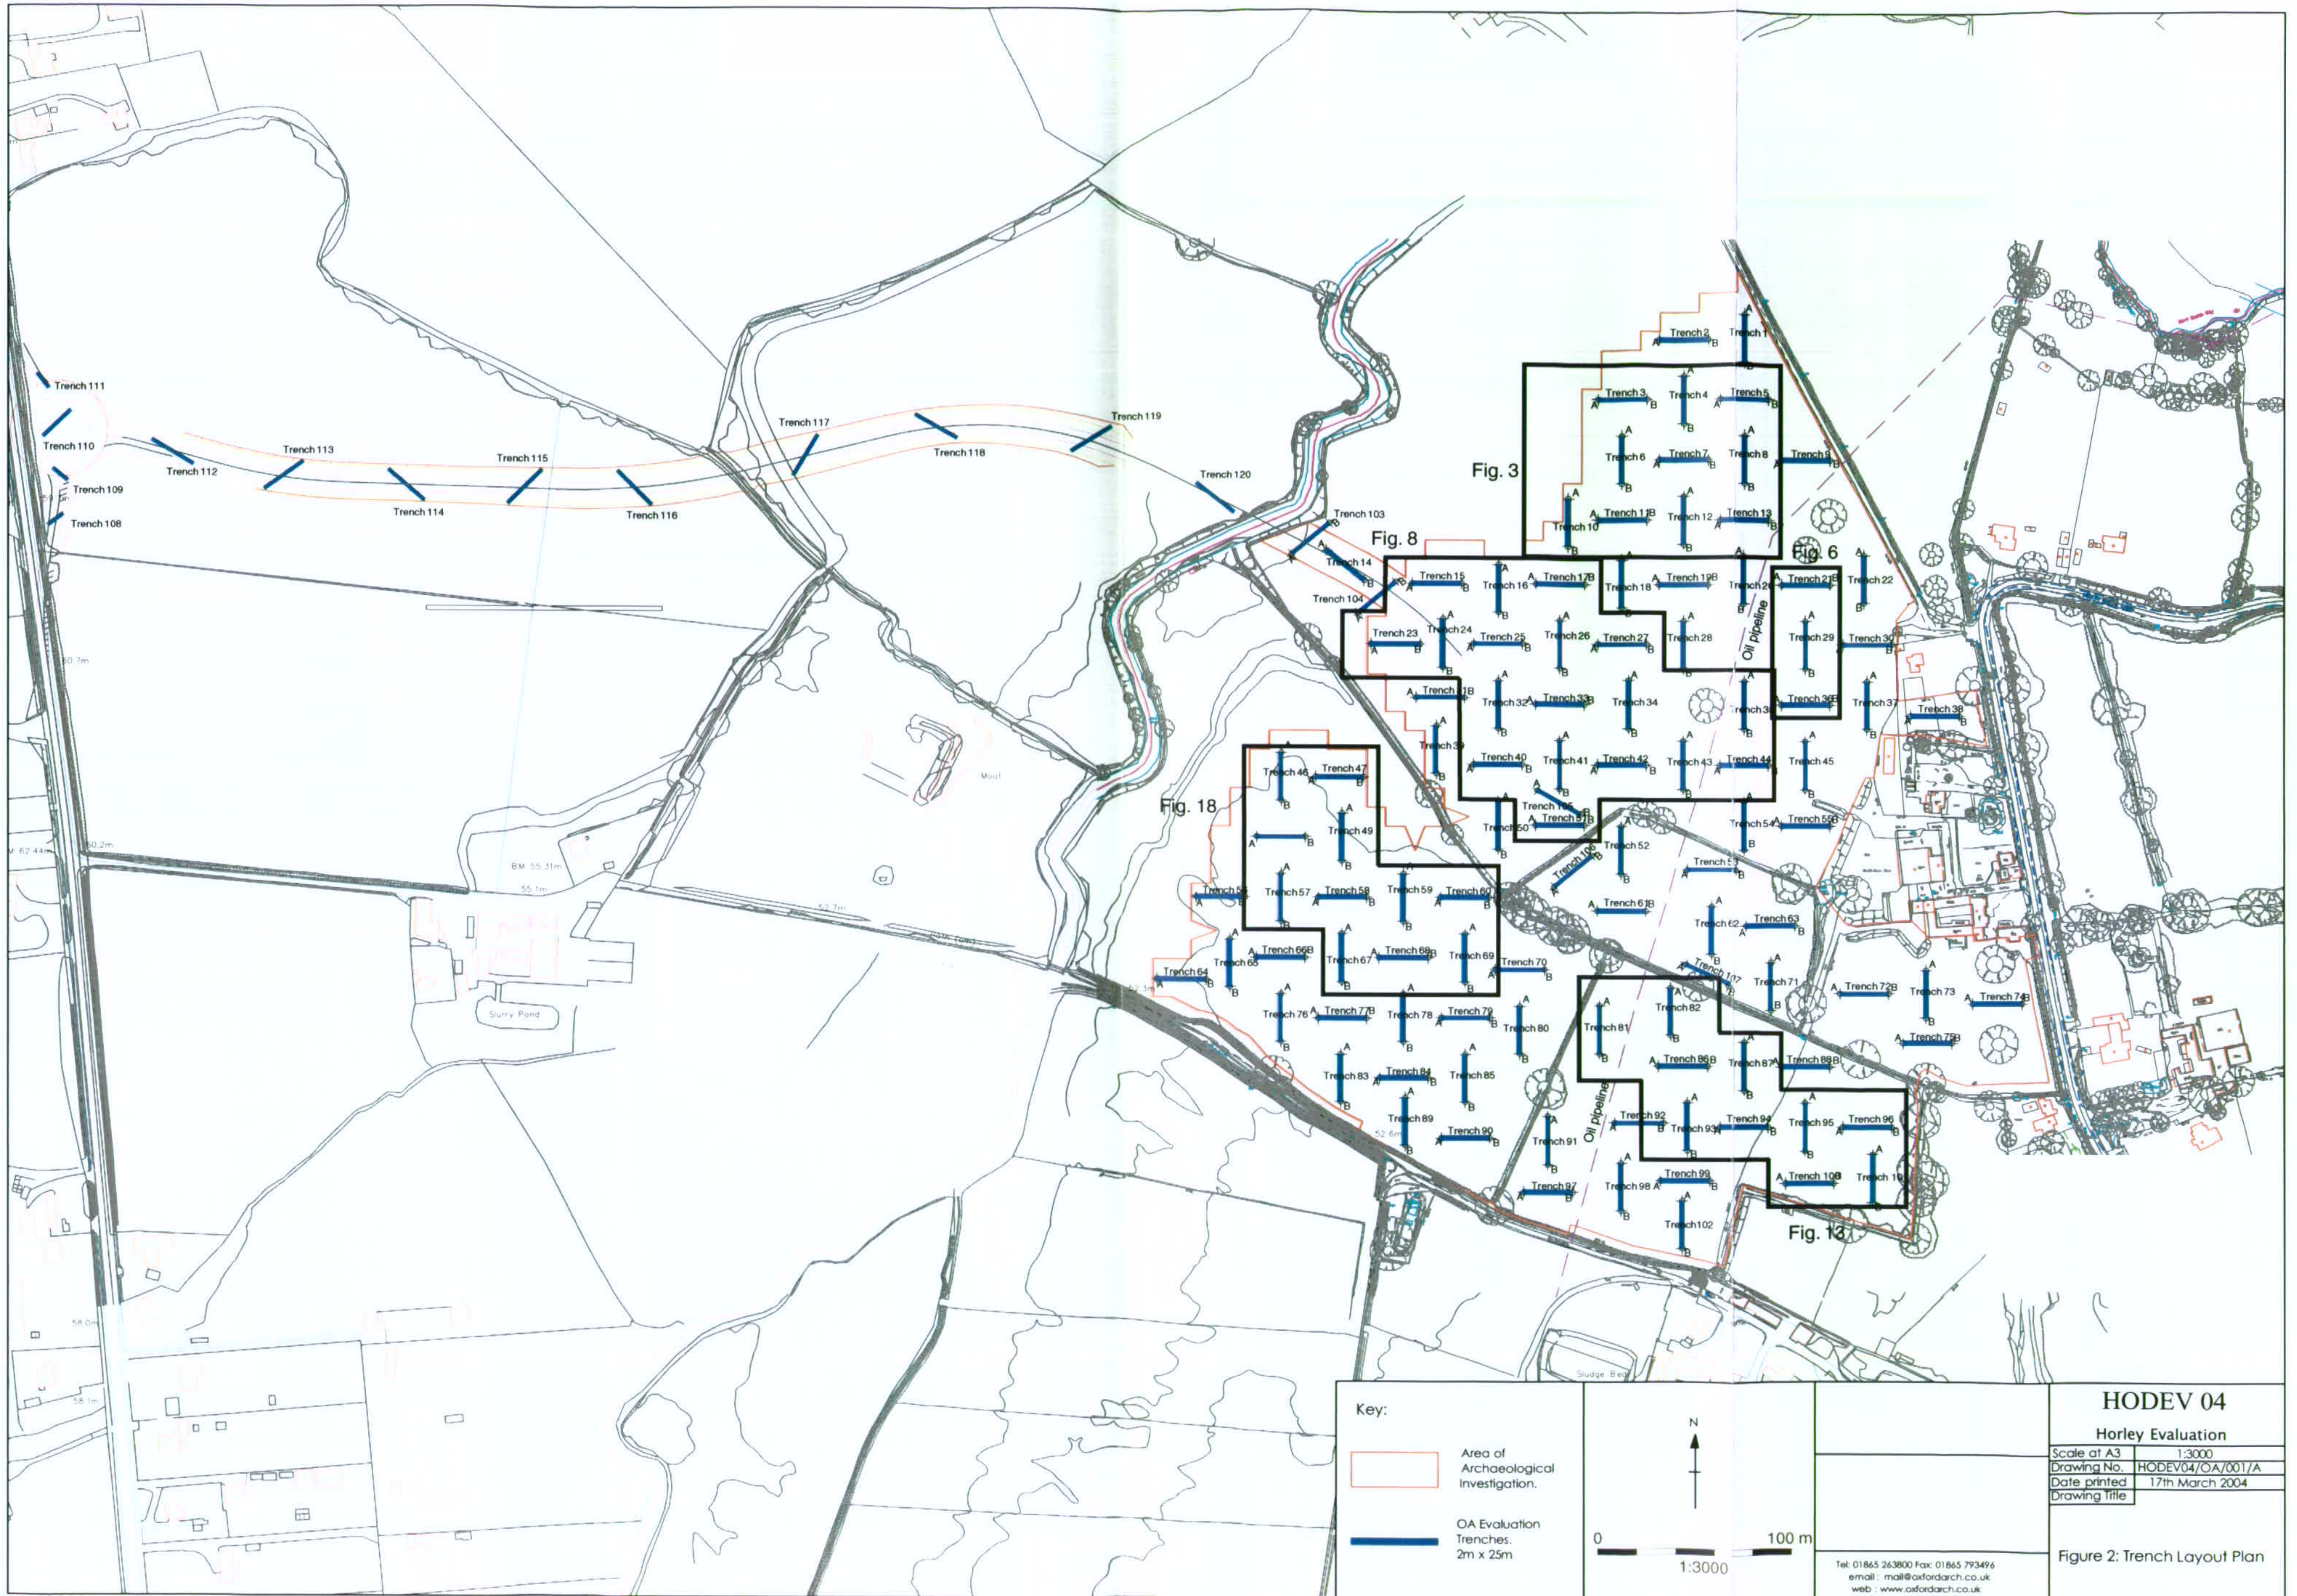

Location of Archive: The archive is currently held at OA, Janus House, Osney Mead, Oxford, OX2 0ES.

Scale 1:50,000

Reproduced from the Landranger 1:50,000 scale by permission of the Ordnance Survey on behalf of The Controller of Her Majesty's Stationery Office
