Is there a report on the subsequent W/B?? (DT?)

An Archaeological Investigation at Fishbourne Road East, Chichester, West Sussex: Interim Report

1998

1998

Summary

Prior to the proposed construction of dwellings at Glebe Meadow, Fishbourne Road East, Chichester (centred NGR SU84180485), the developers, Geoffrey Osborne Limited, commissioned Southern Archaeology to carry out an archaeological investigation as detailed in a Specification for Archaeological Investigation (ref. JAPK FBGLEBE.SPE 18/09/97). The general aim of fieldwork was to record by excavation all archaeological deposits threatened with destruction by groundworks associated with the housing development and to record by plan and (where appropriate) sample excavation all archaeological deposits revealed but not threatened by such groundworks. The SAI proposed two distinct field methodologies: the monitoring by an archaeologist of all groundworks in areas outside the footprints of the dwellings and the total archaeological excavation of the footprints. This report gives the interim results of the latter.

Site location, topography, etc.

The site is a narrow, north/south strip of land bounded on the north by a railway line, on the west and south-west by an embanked section of the A27 and on the east by the gardens of properties on Albert Road and a local authority hostel known as Westward House. Currently a horse pasture, it lies on non-calcareous gley soils (mainly brickearth) and is approximately 400m north of the alluvial deposits of the head of Fishbourne Creek.

Archaeological background

Archaeological excavations carried out on the line of the A27 in 1983 (Cunliffe, Down and Rudkin, 1996) and on what was to become Westward House in 1992 (Kenny, 1992) established that the area is particularly rich in features of later prehistoric and Roman date, some of the latter clearly associated with Fishbourne Palace and others potentially with a pre-existing military site.

In 1995, when it was first proposed that Glebe Meadow be developed, Southern Archaeology carried out an evaluation of the site by trial trenching. The results (Wildman, 1995) confirmed that the types of archaeological features identified immediately to the west and east in 1983 and 1992 were also present at Glebe Meadow. Prehistoric finds included a single microlithic flint waste-flake, found on the surface of the brickearth subsoil, and two prehistoric potsherds (from a small posthole; a further potsherd, a waste-flake and a Mesolithic flint implement occurred as residual material in later contexts). Roman period features included postholes (including one which produced a small, silvered or tinned, copper-alloy belt buckle of AD first century military type), pits and ditches, the last particularly rich in finds. Two large ditches, although rich in Roman finds, also produced medieval potsherds.

As is normally the case at Fishbourne, the topsoil was found to have a depth of up to c.0.5m below surface. The last c.0.25-0.3m (i.e. below modern plough depth) is an old ploughsoil layer buried beneath layers of build up created by tipping the night soil from the streets of Medieval (and post-Medieval?) Chichester. During the course of the 1995 evaluation no attempt was made to recover finds from the buried ploughsoil, though its presence was noted; on other Fishbourne sites it has produced significant numbers of Medieval coins.

Method

Three trenches (see Fig. 1) were marked out on the proposed house footprints and were machine excavated to the surface of the buried ploughsoil. This was then scanned by metal detector before being in turn removed by machine to reveal archaeological features cut into the natural brickearth subsoil or deposits lying on it. All archaeological contexts were given unique numbers, were recorded in plan (at 1:20 scale), partially excavated and recorded in section (at 1:10 scale) and, in the case of discrete features, completely excavated.

Results (see Fig. 2)

The dominant features were a series of approximately north-south and east-west ditches, usually with accompanying fences. Additional features were a large number of postholes and several gullies and small pits. Identification of the date and function of these features awaits full analysis of the finds and archaeo-environmental/sedimentological samples; however interim 'spot-dates' have been provided by inspection of the coarse pottery and coins (see Appendix 1; note that these are the dates of the fills of the ditches, not those of their periods of use) and preliminary conclusions are discussed below.

Unfortunately, all aspects of the archaeological excavations were hindered by heavy rain and a consequently extremely high water table. All excavated features promptly filled with water and at various times the trenches themselves had to be pumped dry before digging could take place. Under such conditions it is unfortunate but inevitable that some features may have been misinterpreted or overlooked.

Discussion (1995 contexts are in brackets)

Prehistoric

Small and abraded prehistoric (Bronze Age?) pottery sherds from the fills of stakehole 47, posthole (18)/95 and gully 61 are probably residual, those from posthole (10)/129, gully 99 and spreads 86 and 192 certainly are.

Roman

For ease of description the features can be grouped as follows:

N-S and E-W ditches, gullies and fences

Ditches 9, 17, 179, 194, 203 and 252, gullies 41, 87/104 and 180, fences 71~79, 95~155, 114~120 and 198~260

NNW-SSE and WSW-ENE ditches, gullies and fences

Ditches (36), (38), 6/211, 24 and 189, gullies 61 and 66/182, fences 43~250, 69~298, 248~292 and 256~286.

Other alignments

Ditches 10, 29 and 133, gullies 82 and 177.

Other

Ring-gully 99, gullies 138 and 296, various pits and (apparently) non-fence postholes.

Many of the ditches have fences either in direct association or on the same line. These and unrelated ditches and fences are presumably land boundaries and/or drainage features. Whether they relate to military, industrial or agricultural activity or are garden features is, for now, unknown. Ditch 211, which (in trench 3) has three flanking fences, may be an aqueduct.

Most of the features produced mainly finds typical of the 1^{st} and 2^{nd} century Fishbourne Palace site to the east. These include relatively large quantities of imported fineware pottery and early types of tile. Also included, however, are small quantities of 3^{rd} century pottery. Given the sheer quantities of tile and masonry and the apparent lack of significant masonry buildings in the immediate vicinity of the site, it seems likely that most features were deliberately infilled with a combination of unwanted building materials and old domestic debris. Possible interpretations are:

- 1. The features were infilled in the 3rd century with waste materials from the Palace site and from contemporary sources.
- 2. The features were infilled after the 3rd century, with waste materials from the Palace and other sites, using methods which included little or no contemporary waste or at a time when the material culture was relatively poor.

Medieval and later

The buried ploughsoil produced small quantities of Medieval and post-Medieval pottery and a 14th century coin.

Other

Compilation of a final report awaits the results of the monitoring phase. It is intended that the ultimate repository of the finds and archive will be Fishbourne Palace.
