## Phase 5.4

A shallow robber trench with traces of masonry formed the north portion of a major masonry building. It lay to the west of the west end of $S 77$ which it probably replaced, and was associated with Route M. Probably oriented north-south, it was 3.50 m wide internally; there was space for a compartment about 6.50 m long, of which 3 m walling survived. When spatial analysis was used, a building of two squares of 3.50 m was used to reconstruct the plan. This gave a building 7.50 m long and 4.50 wide, the walls being about 0.45 m thick.

## Phase 5.5

The northern perimeter wall S76, close to S80, was demolished and built further north, thus giving better access to S80.

## Dating

No contemporary finds-bearing contexts survived later disturbance. Dating is relative, depending upon structural relationships.

| 39 | 81 | 77 |
|  | Bank 5 |  |

Key finds contexts none directly attributable to the structure, but ceramics dating to phase 5.3 were in the base of the building hollow.

## Summary description

A sharply-defined rectangular depression to the east of S16 was only recognised during the latter part of spatial analysis.

## Phase 5.3

The slight platform for a rectangular building, 8 m by 9.15 m and up to 0.20 m high, was seen as a sharply cut depression' to the south-east corner of S16. It almost filled the space between the east graveyard wall and perimeter wall S77. There were no footings or construction features such as postholes; it cut into the phase 5.2 Bank 5. The east part of the building platform rested on the remnant of Bank 5, on its flatter, east slope. The west part of the room was partly on the top of the bank with the western slope made up with gravels to make a level floor. Finds dated to phases 5.25.3 lay at the base.

Dating the structure partly relied upon its spatial alignment. It was aligned with two phase 5.3 constructions, S43 and S45 in the south court. S39's south corner was at an angle of $45^{\circ}$ from the centre of the north wall, the same ratio of shift from the original grid orientation, but from an alternative direction. It had been filled with destruction debris associated with the phase 6.1 remodelling, so it is suggested that a perishable superstructure was still partially extant. S65 was built immediately to the north, its placing suggests that S 81 was still visible.

## Summary description

The remnants of a building occupied land to the east and north of S54 to which it was attached. Its north and west walls comprised gate S79 and part of the northern enclosure wall S76, replacing S78.

## Phase 5.4

This area had suffered from severe robbing; S85 was among a complex of largely unattached walls to the north and east of S54. A patchy perimeter wall S76 ran eastwest along the edge of the main buildings area, north of S16 and probably joined the north wall of S19. An opening in this perimeter wall, S79, and to the west of gate S76, led into S 85 , the space occupied by the filled in east-west stretch of CF29 to the north of S16.

A phase 5.3 T-shaped wall S78 [26.08] was constructed abutting the wall west of the gate S76, and was demolished to make way for another wall further east. Only the stub end of this wall survived, and this was the eastern side of an entrance into S85. The western side of this entrance abutted the north-east corner of S54. A third, western entrance was formed by the north wall of S54 and the western wall of S79. This building was about 5 m square except for the corner of S54 [26.09].

## Phase 5.5

The room had its western entrance blocked. This was an externally constructed extension of the west wall of gate S79, joining it with the north wall of S54 [26.10].

Gate S76 and its walling to the east had been demolished [26.10], but were replaced by wall S76B a little further north. This new perimeter wall had to curve south to complete the circuit, joining the east side of S79 and its junction with the north wall
of S85. This large structure was the only way into the complex from the north, and any travellers would need to enter by S79 and leave by the south entrance in S85.

## Phase 5.6

The east wall was demolished, and replaced with a wall 0.70 m wide and about 6 m long. This constricted the width of the room to about 2 m . The result of this was to remove the southern entrance to $S 85$, but since the southern wall of the building was retained, a new, wider entrance to the east was formed. A large masonry pier base or buttress was constructed over the phase 5.5 blocking at the south end of S79, close to the north-east corner of S54 [26.11].

## Phase 6.1

The building was demolished and the area subject to periodic robbing compounded by antiquarian activities at the beginning of the 20th century.

| 5.2 | $23 / 236$ | Posthole fill (with | - | - | slag |  |

Fe smithing slag, Pb run-off, and partially-forged Fe were found in destruction levels overlying the successor building S23; this could have been caused by robbing levels through into S86.

## Summary description

A two-chambered building was oriented east-west, with the larger chamber to the west. It contained several hearths or burnt areas.

## Phase 5.1

S18 was replaced by a building that used almost the same basic square in its larger, western, chamber: this time 6.10 m . The south and west limits of the building were found by geometry. The north side may have been partially left open, since a group of four postholes and a circle of burning is interpreted as hearth SS3. Two post pits formed the south-east and north-east corners, and a post lay along the east wall or partition.

The second chamber to the east was smaller, but shared the same centre line. The eastern posts shared some of the same large irregular posts in the east side of S18 Version 1. The basic square measured 4.80 m , with a division at the half square. The second chamber shared its west wall with the larger room giving 10.90 m as the total length of the building. Bisected by the half square was a large circular hearth SS55 which had clunch hearthstones. This was repaired with a clunch slab. It is possible that the earlier part of SS55 belonged to S18, and is shown on both plans. Burnt clay loams surrounded the slab.

Sealed beneath the later clay levels of S86's floor were spreads of decayed burnt clay or daub belonging to S18 beneath, and coinciding with that building's west wall. The chambers were filled with dense deposits of black charcoal and clay, and the building was cut into by features belonging to S23. S23 was a larger, stone version of S86.

## Exterior surfaces

There was a build-up of burning layers between the structure and the fishpond CF33, some of which contained environmental evidence. Pebbly clay loams were sealed by the same dense charcoal and clay layer seen inside the building.

|  | 6 | 5 |

Key finds contexts none that can be safely attributed to the building

## Summary description

Fragmentary remains of slots and worn floor areas forming a two-bay structure.

## Phase 3.2

A single complex structure, S 6 , has been divided into two more satisfactory buildings. S87 occupied a similar space to that of $\mathbf{S 6}$, but was slightly further north. It sat over the west bay; the west wall was missing. The building comprised a series of 21 post pits and postholes and a short slot forming three sides of a square with sides of 5.10 m long. It is possible that, like its predecessor S6, it continued to the east, but no evidence remained to support this other than a single posthole which lay on the central alignment found by geometry. The measurement was calculated by taking perpendicular lines through most of the postholes, starting with the north-east alignment. This gave a larger square, some 5.20 m across. One of the larger posts in the north-east corner cut the north slot of S6.

## Associated features and surfaces

The pit complex S67, lay close by.

## Dating

All the structural features cut natural subsoil, and were sealed beneath plough soil that also sealed the contemporary S5. Both S5 and S6 must be stratigraphically earlier than S24 (?phase 5) which in turn sealed the ploughsoil.

Key finds contexts intrusive only from construction of S21

## Summary description

A bow-shaped building $\mathbf{S 8}$ comprising postholes and slots, was divided into two buildings, S8 and S88. They lay immediately north of S7 and south of the northern run of CF29. The postholes strongly suggested that they lay in two arcs. It may have been contemporary with $\mathrm{S7}$ for a short time.

## Phase 4.2

An arc of at least seven postholes formed part of the north wall of a building; five opposing posts were all that survived of the south wall. The building was interpreted originally as incorporated into S8 as rows of posts external to a mainly slotconstructed building, although it was not clear how these functioned. After spatial analysis the slots and posts were separated out into two more convincing structures. On the basis of structural type, S 88 was considered to be the later of the two, constructed around the outside of S8. The building was designed in eight squares with sides of 2.70 m , giving a probable length of about 10.80 m and a width of 5.40 m .

## Exterior features

The structure was set equidistant from S7 and the east-west stretch of CF29.
Subsequent dating of mixed quartz ware A16, and the quantities of this fabric in association, raised the possibility of the building being middle Saxon. See [11].

## Summary description

A group of truncated postholes and stakeholes was recorded to the north of S 1 ; they were probably structural but no form could be discerned.

[^0]:    ' Editor's note: this sentence is confusing - a platform is normally a raised area, but here it was seen as a 'sharply cut depression'. The same feature is shown on plan 27.02 as a raised area.
