**Archaeological Evaluation**

**Non Technical Summary**

*An Archaeological Evaluation was undertaken by MAP Archaeological Consultancy Ltd at 10 Crab Lane, Seamer, near Scarborough, North Yorkshire, from the 3<sup>rd</sup> to the 12<sup>h</sup> July 2006. The work was undertaken in advance of a proposed residential re-development of the site (Planning Application Ref: 06/01114/FL).*

*The evaluation consisted of six trial trenches excavated in order to establish the nature, location, extent and state of preservation of any archaeological deposits in the proposed development area.*

*The evaluation located four gullies and two ditches. Finds were restricted to a small assemblage of modern material from the topsoil in Trench 4 and a single sherd of Romano-British pottery from Ditch 4005.*

*The close proximity of No. 10 Crab Lane to the previous archaeological sites at Persimmon's Crossgates I – III suggests that the archaeological activity recorded is related to the extensive Iron Age/Romano-British landscape so far documented in Seamer parish.*

**1. Introduction**

- 1.1 This report sets out the results of an archaeological evaluation undertaken by MAP Archaeological Consultancy Ltd. on land to the rear of 12-22 Crab Lane, Seamer, North Yorkshire (Figs. 1 & 2 : TA 0260 8386). The excavation took place over two weeks in July 2006, during a particularly very hot and very dry spell of weather.

- 1.2 Residential development is proposed at 10 Crab Lane under an outline planning application submitted on 31 May 2006 (06/01114/FL). The development will involve the erection of three bungalows and three dormer houses along with their associated infrastructure.
- 1.3 The excavation was carried out on behalf of, and funded by, Thompson Homes.
- 1.4 The MAP site code for the project was 01-07-06.
- 1.5 All maps within this report have been reproduced from the Ordnance Survey with the permission of the Controller of Her Majesty's Stationery Office, Crown Copyright, licence No. AL 50453A.

## **2. Site Description**

- 2.1 The site lies on the west side of Crab Lane, forming a rectangular block behind nos. 12 - 22 Crab Lane, measuring approximately 0.40 ha (Pls. 1 & 2). An unoccupied dwelling lies at the north of the plot, with the remains of at least four outbuildings distributed across the remaining area. Access is from Crab Lane between Nos. 8 and 12 (Fig. 1 : Pls. 3 & 4)
- 2.2 The site was covered in long grass with overgrown shrubs and areas of brambles and nettles (Pls. 1 & 2). Due to the height of the vegetation it was considered that the site was unsuitable for geophysical survey.
- 2.3 Topgraphically the site has a pronounced slope aligned north to south (46.23m in the north to 45.18m in the south).
- 2.4 The site stands on soils of the Wick 1 Association, deep well-drained loamy and sandy soils overlying glaciofluvial drift (Mackney *et al*).

### **3. Historical and Archaeological Background**

- 3.1 The manor of Seamer was held by *Carle* before the Norman conquest, after which it passed to William de Percy. The Percy family held it until 1536-7 (VCH 1914).
- 3.2 The name Seamer, first instanced as *Semaer* at the Domesday Survey (1086) is derived from the Old English words for 'sea' or 'lake' plus 'pool' (Smith 1928). Crossgates was a name attached to a public house at the time of the First Edition Ordnance Survey map (1854).
- 3.3 The site lay within Low Field, one of Seamer's medieval Open Fields. No aerial photographs showing cropmarks exist for the site. Aerial photography on the sandier soils on the southern side of the Vale of Pickering has identified ribbon or ladder settlement and Iron Age/Romano-British field systems. Airborne multi-spectral techniques have identified a pattern of enclosures on the northern side of the Vale including features in the vicinity of the site (D. Powlesland, pers. comm.).
- 3.4 The proposed development site is situated within the same general landscape of late prehistoric remains that was examined in advance of the Persimmon housing development (Crossgates I and II : Fig. 2).
- 3.5 At Crossgates I a geophysical survey carried out in 1988 located a series of linear and curvilinear anomalies, along with a number of enclosures (GSB 1988). These anomalies were the subject of a series of sample excavations and Watching Briefs at various dates during 1989-92, which recorded a pair of square ditch barrows associated with a trackway, a ring-gully, posthole structures, V-profiled enclosure ditches and other features of Iron Age through to medieval date.
- 3.6 At Crossgates II, geophysical survey in 1996 (GSB 1996) identified a series of rectilinear enclosures that were evaluated in the following year (MAP 1998). A Romano-British enclosure was located at the extreme northwest of the

excavated area, associated with a field system. Subsequent excavations carried out in the spring of 1999 examined the interior of the enclosure revealing postholes and pits (MAP 1999). The examination of the entrance area showed that it had been widened in the late 1<sup>st</sup> / early 2<sup>nd</sup> century, with a stone entrance structure being built over the earlier ditch terminals. The remodeling of the entrance was contemporary with the laying down of a substantial clay and cobble raft to form the foundations of a stone-walled building. The building and its enclosure are now scheduled and form an open area within Persimmon's Crab Lane development.

- 3.7 To the west of Crab Lane geophysical survey identified a rectangular enclosure subdivided into three compartments. An open-area excavation of the enclosure revealed two Bronze Age burials pre-dating the enclosure, which housed ring-gully structures, areas of pitting and industrial features including an early 1<sup>st</sup> century pottery kiln.
- 3.8 Geophysical survey of the entrance into the Persimmon development, which runs southwards from the B1261 Seamer to Scarborough Road (i.e. the area 160m west of the proposed development), suggested a tailing-away in archaeological activity at this location. This was confirmed by evaluation excavations, a double-ditched boundary and trackway being the only archaeological feature identified.
- 3.9 In 1857 Anglian graves with their associated pottery and jewelry were uncovered during limestone extraction at Seamer Quarry c.150m north of the proposed development (Elgee and Elgee 1933).

#### **4. Aims and Objectives**

- 4.1 The objectives of the archaeological evaluation work within the proposed development area were:
  - i. to determine by means of trial trenching, the nature, depth, extent and state of preservation of any archaeological deposits to be affected by the development proposals. Trial trenches of sufficient size and depth to provide this

information will be excavated, and archaeological deposits will be explicitly related to depths below existing surface and actual heights in relation to Ordnance Datum.

- ii. to prepare a report summarising the results of the work and assessing the archaeological implications of proposed development
- iii. to prepare and submit a suitable archive to the appropriate museum.

## **5. Methodology**

- 5.1 All the overburden (topsoil and subsoil) was removed using a back-acting mechanical excavator, fitted with a toothless bucket. All machine excavations were undertaken under full archaeological supervision.
- 5.2 After removal of overburden, excavation proceeded by hand. Each archaeological feature or deposit was recorded on *pro-forma* Context Record Sheets (Appendix 1), according to guidelines laid down in the MAP Excavation Manual. A total of 36 contexts were recorded.
- 5.3 The finds assemblage consisted of clay tobacco pipe (1 fragment), pottery (3 sherds : Appendix 2).
- 5.4 Deposits that were removed as part of the overburden were recorded in section and by record only. All other archaeological deposits and features were recorded in plan at a scale of 1:20 on permatrace drafting film. Elevations and sections of features and individual layers were drawn at a scale of 1:10 and included an Ordnance Survey Datum height (Appendices 1 and 3). In total 96 drawings were archived; including 14 elevations, 50 plans and 32 sections.
- 5.5 A full photographic record comprising colour print, monochrome print and colour transparencies, was made. A total of 3 35mm films were used; including. The photographic record of features and general trench shots, included a film register noting film number, shot number, location of shot, the direction of the shot, and a brief description of the subject (Appendix 4).

- 5.6 Only one environmental sample was taken from Ditch 4005 in Trench 4 for general biological analysis (Appendix 5).

## **6. Results**

- 6.1 A total of six areas were evaluated (Trenches 1 – 6 ; Fig. 3 :Pls. 5-22), only four of which produced evidence for archaeological activity (Trenches 1, 3, 4 & 5), consisting of four gullies, and two ditches.

- 6.2 All of these features were sealed by the topsoil (measuring 0.19m - 0.28m in depth) and a subsoil deposit (0.22m - 0.28m in depth), and cut into the natural clays and gravels.

### **6.3 The Gullies**

- 6.3.1 Excavation of Trench 1 (Fig. 4) located two gullies (contexts **1003 & 1007**). Both of the features were aligned north to south, only 0.68m and 0.74m wide and 0.36m and 0.26m in depth respectively, with rounded 'v' shaped profiles. Gully 1003 terminated within Trench 1 whereas Gully 1007 continued to the south. No finds were recovered from their single associated fills (contexts 1002 & 1006). Considering the similar size and shape, these features may be contemporary and share a common function.

- 6.3.2 Gullies **5004 and 5005** were excavated in Trench 5 (Fig. 7 ; Pls. 19-21), again aligned north to south and continuing beyond the confines of Trench 5, these features were measured 0.74m and 0.42m in width with a depth of 0.30m and 0.50m. With alike fills (contexts 5002 and 5003), identical rounded 'v' shaped profiles, and no associated finds, it would appear that the gullies are similar to those recorded in Trench 1. However, as there is no record of such features in Trench 3 (Fig. 8), they cannot be classed as continuations of the Trench 1 features.

### **6.4 The Ditches**

- 6.4.1 Within the central area of the site excavation located two ditches (contexts **3005 & 4005**). Both of these features had identical 'u' shaped profiles (Figs. 5

& 6 : Pls. 10-17)), identical depths and of variable width (1.17m and 1.70m). Both of these ditches are on an identical alignment and would appear to be segments excavated through the same feature (Fig. 8). Only a single find was recovered from the primary fill (4004), a Grey ware rim of Romano-British date.

## **6.5 Trenches 2 & 6**

- 6.5.1 Trenches 2 and 6 were located on the western side of the evaluation area (Fig. 3). No features were observed after the mechanical removal of the topsoil and subsoil (Pls. 9 & 22). Both trenches were cleaned and allowed to weather, however, no archaeological features were apparent in these trenches.

## **7. Discussion and Conclusions**

- 7.1 The absence of material finds other than those of a modern date from Trench 4 suggest that the site was open land prior to the development of adjacent land in the 20<sup>th</sup> and 21<sup>st</sup> centuries for residential expansion.
- 7.2 The evaluation recorded archaeological activity in the form of four undated gullies which were all very similar in nature suggesting a common function. The full extent of these features is unknown and would require further work at the site for clarification.
- 7.3 Perhaps the most interesting feature was recorded in Trenches 3 and 4 and represented a curvi-linear ditch of Romano-British date. Again the full extent of this feature is currently unknown, but current development proposals (Fig. 8) would have a considerable affect on this feature, and therefore need to be defined in greater detail.
- 7.4 The features so far observed are of an early date and possibly related to the extensive Iron Age/Romano-British landscape documented to the south of the site at the Persimmon's developments - Crossgates II and III. However, work on Persimmon's Crossgates I development (to the east of the site) also

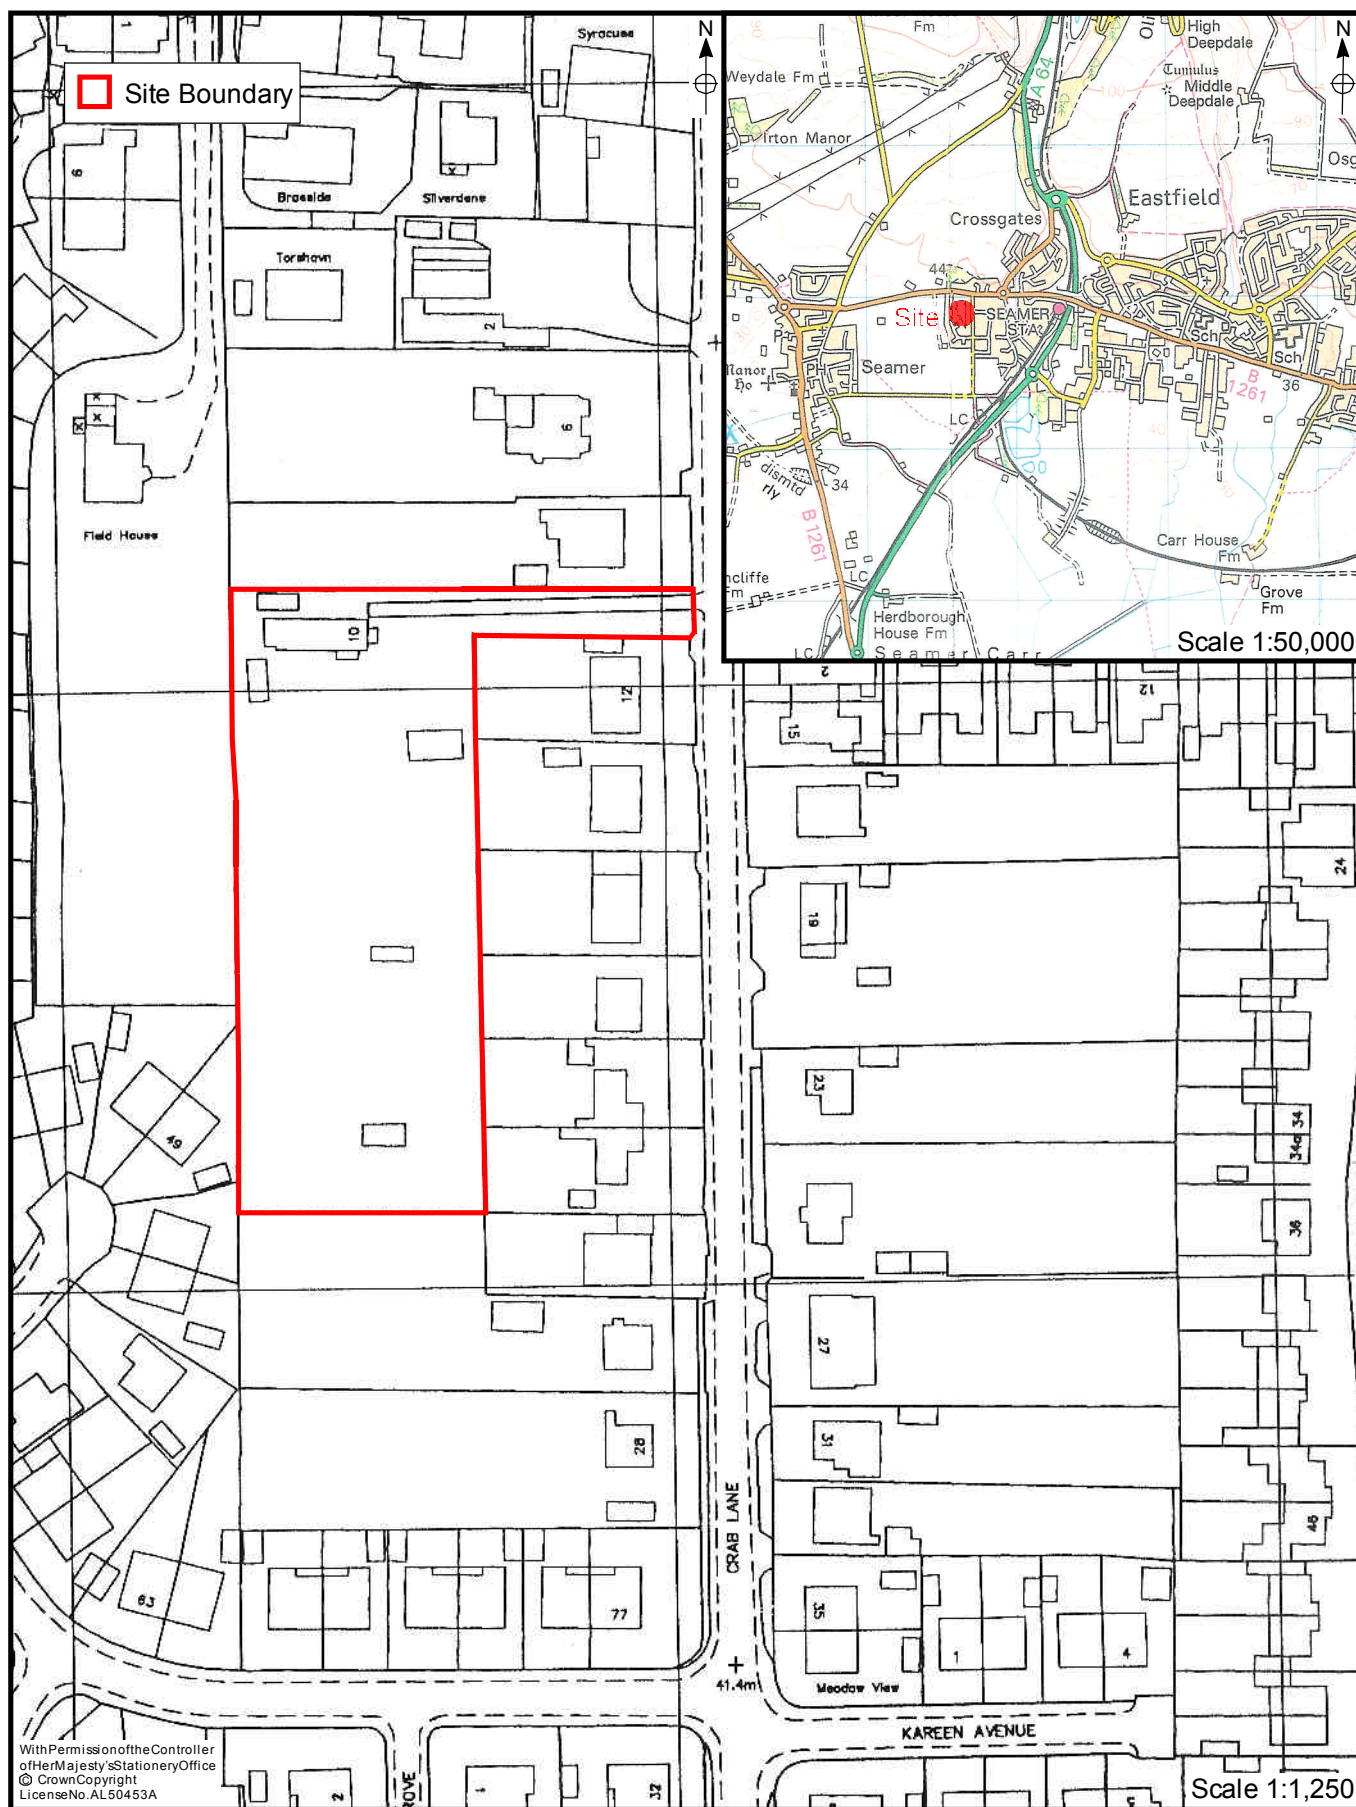

located a number of features (pits, postholes and linear ditches) of an even earlier Bronze Age/Iron Age date.
