Environmental Samples/ Flotation Results

1. Assessment Objectives

- 1.1. The aim of the manual flotation process was to separate any environmental material held in a sample tub. Both the float and the residue were then weighed.

2. Methodology

- 2.1. A flotation lab sheet was filled in for each of the samples which underwent the manual flotation programme. Site codes, context numbers and sample numbers were recorded on lab sheets for each of the samples.
- 2.2. Each sample was then weighed separately, this information was then recorded on the individual lab sheets.
- 2.3. A smear of the sample was then taken and smeared onto that sample's lab sheet. This smear was used to obtain a secondary standard munsell colour.
- 2.4. 3 litres of the sample were then measured out, and the volume then recorded on the lab sheet. The 3-litre sample was placed into a bucket; water was then added and then stirred well

- 2.5. The liquid sample was then decanted through a 500µ sieve, anything recovered from this process is referred to as flots
- 2.6. This process of decanting was repeated while the water remained reasonably clean and no more obvious materials like charcoal were present. The remaining residues were then transferred to a clean 500µ and rinsed through.
- 2.7. All the above stages were repeated until all the samples had been processed.
- 2.8. The flots and residue samples were then rinsed well, labelled with their site code, context number, and sample number and left overnight to drain and dry.
- 2.9. After drying the flots were placed onto a clean piece of newspaper, examined for any finds or environmental material. The flots were then carefully wrapped and placed into a plastic flots bag. The bagged flots were then weighed; this information was recorded on the lab sheets
- 2.10. The remaining residue sample was then examined for finds and other environmental material. Any materials recovered from the residues would have been recorded on a lab sheet and bagged separately. Once the residue had gone through this process any remaining material was discarded.

3. Results

- 3.1. No environmental material was recovered from any of the samples, apart from a few animal bones, which were recovered from sample 3 (Context 2017). Samples 1 and 2 (Contexts 1014 and 1021) revealed nothing in the way of finds or environmental material and could be considered barren. Nothing was recovered from any of the residues.

4. Conclusions

- 4.1 The lack of any environmental material within these deposits would suggest that the sampled pits were not primarily used for rubbish disposal but had been intended for some other purpose.
