

## **Survey and Levels Data**

**TCG09**

### **Evaluation \ Watching Brief**

The locations of the areas of excavation were recorded by MOLA Geomatics and the data transferred onto the Ordnance Survey grid. The details of both surveys are given on the attached sheets.

The heights of archaeological features and deposits were recorded relative to Ordnance Datum. Levels data for the site was derived from an Ordnance Survey benchmark (value 26.02m OD) located on the north-west corner of St Patrick's Church adjacent to the site. This data was used in the Geomatics surveys and was used to establish temporary benchmarks (TBMs) on site.

### **Standing Building Survey**

The location of the building was established using the current Ordnance Survey mapping. As no 'below ground' work was involved, levels data was not required for this phase of the project.
