Truncated?	Has the upper surface been exposed to weathering?
Root Penetration?	Is the deposit a laminate?
Bioturbation (e.g. Worm, mole etc?)	Has the deposit been created in a single episode?
Is the upper surface distinct, graded, uneven etc?	Has the deposit accumulated over a long period?
Is the upper surface compacted?	Is there evidence of waterfogging?
Is the deposit sealed?	Has deposit been formed by flowing water/standing water/wind?

 Finish
 Coursing/Bond
 Direction of Faces
 Foundation

Aligned NW-SE
 c. 9.7m in length and 0.60 in width.
 Respects the alignment of mineshaft [1032], it comprised irregular sized and shaped unmortared stones placed within a sandy silt matrix.
