	3	0.33mW x 0.15mD x 1.00mL
	4	SHARP
	5	MORE VERTICAL THAN SLOPING
	6	SHARP ON SE SIDE, NOT PERCEPTIBLE SW
	7	RELATIVELY FLAT
	8	SE TO NW

Truncated?	Has the upper surface been exposed to weathering?
Root Penetration?	Is the deposit a laminate?
Bioturbation (e.g. Worm, mole etc?)	Has the deposit been created in a single episode?
Is the upper surface distinct, graded, uneven etc?	Has the deposit accumulated over a long period?
Is the upper surface compacted?	Is there evidence of waterlogging?
Is the deposit sealed?	Has deposit been formed by flowing water/standing water/wind?

**Context Description**  
 It is a linear gully that has an orientation of NW to SE. It had a sharp break of slope at the top. Its sides are more vertical than sloping. The break of slope is sharp on the SE but not perceptible in the SW. The base is relatively flat. It contains 1 fill (1701) + produced no finds.

GR 1702  
 There is a sump at the NW end.
