An Archaeological Watching Brief At Ferndale Drive, Ratby, Leicestershire. (SK 518 058)

Leon Hunt

Summary

An archaeological watching brief was undertaken by University of Leicester Archaeological Services (ULAS) at Ferndale Drive, Ratby, Leicestershire during ground-works associated with the building of new houses. The site lies within an area of archaeological importance adjacent to previous finds of Roman date and close to the line of an important Roman road. The watching brief revealed many finds from Roman and medieval periods, including coins, pottery and brooches. No features were discovered that could be dated. The archive will be deposited with Leicestershire County Council Heritage Services with accession number X.A35.2001.

Introduction

University of Leicester Archaeological Services (ULAS) were commissioned by Cawrey Ltd to carry out a watching brief during the excavation of all ground disturbances, including topsoil stripping, foundation trenches and service trenches at Ferndale Drive, Ratby, Leicestershire (grid ref. SK 518 058). Archaeological work was required as a condition of the planning permission granted by Leicestershire County Council (planning application No. 98/00324/FUL/).

The site lies within an area of archaeological importance adjacent to previous finds of Roman date and close to the line of an important Roman road. During a previous watching brief carried out by ULAS in 2000 several sherds of medieval and post-medieval pottery were recovered, along with a single Roman sherd and evidence of a medieval field system (Higgins 2000).

The planned development of new homes with associated services, garages and access roads was seen to have the potential to have a damaging impact on any archaeological remains if present.

The correspondence from the Senior Archaeologist, County Archaeology, Leicestershire Museums Service, dated 16th March 1999, detailed the need for a watching brief during the demolition and ground-works. A Design Specification for a watching brief was prepared by ULAS (Appendix 3).

Site Location and Geology

Ratby is located approximately 8km to the west of central Leicester close to the M1 motorway. The development site lies just to the west of the motorway close to the medieval core of Ratby. It lies approximately 2.5km to the east of Bury Camp, a large rectangular earthwork, which is thought to date from the Iron Age (Liddle 1982). A probable Roman road lies just to the north of the site. This is thought to run southeast to northwest and is thought to branch away from another road, which runs between Leicester and Mancetter in Warwickshire.

The Ordnance Survey Geological Survey of Great Britain (Solid and Drift) Sheet 170 indicates that the underlying geology is likely to consist of Boulder Clay. The land lies at a height of c.90m.

Figure 1: Site Location OS Map Landranger 140: Leicester, Coventry & Rugby
Scale 1:50 000 ©Crown Copyright. Licence No. 100021186.

Aims and Methods

The purpose of the watching brief was to ascertain whether archaeological deposits were present. If so, the character, extent and date range of any deposits identified would be established, in order to assess their significance (see Appendices, Design Specification). Recording of these deposits would be carried out as appropriate, and an archive and this report produced. The work followed the Institute of Field Archaeologists (IFA) *Standard and Guidance for Archaeological Watching Briefs*, and adhered to the University's Health and Safety policy.

An archaeologist visited the site thirteen times between 05/07/01 and 27/09/01 and seven times between 20/03/03 and 21/07/03 and ground-works associated with the development were observed. This included topsoil stripping and the excavation of trenches for services and foundations. JCB training was also carried out on selected areas of the site and these procedures were also observed.

The spoil heaps were also checked for archaeological finds. All the work was carried out in close liaison with the Ratby archaeological warden Mr. Neil Glenister, who also carried out intermittent visits to the site and frequently surveyed the area with a metal detector.

Plate 1: Aerial photograph of development site, with study areas highlighted in green. Previously watched areas (Higgins 2000) highlighted in red.

Results

An archaeologist visited the site 13 times between 05/07/01 and 27/09/01 and topsoil stripping and trenching for services was observed throughout this time. Throughout the site the topsoil consisted of 0.2-0.3m of dark brown loam, the subsoil consisted of 0.2m of reddish mid-brown firm clay. The natural substratum consisted of orangey brown slightly sandy silty clay with patches of rounded pebbles, with some variation in clay colour between areas. The trenches were between 0.6m and 1.2m wide and between 0.75m and 4m deep.

During the visits of 05/07/01 and 06/07/01 several features were observed. These included areas of metallised surfaces, most likely old field tracks, areas of loose large pebbles and a small pit. This pit was 0.4m in diameter and was 0.14m deep. It was

roughly circular in plan and contained a fill of blueish grey clay with some charcoal flecks. No finds were found within the features to date them. However, a sherd of Roman pottery was located 3m from the pit. Other finds from this visit included brick fragments, a sherd of Potters Marsden pottery and some other pieces of glazed pottery.

A slate drain and a small area of loose pebbles were also observed (Figure 3). No features were observed during the stripping that was watched on 09/07/01.

During the visit on 10/07/01 service trenches were observed. No features were observed, but Mr Glenister discovered several interesting finds. These included two Roman fibula brooches and a collection of ceramic finds, which included medieval pottery (Appendix 1). The following visits of 11/07/01 and 12/07/01 revealed no features that were archaeological. However, two sherds of pottery were discovered, one medieval, the other post-medieval. The area previously watched by ULAS in 2000 (Higgins 2000) was observed on 11/07/01. Areas of pebbles or cobbles were also observed, mainly around the entrances to the fields, but there was also evidence of cobbling in the centre of the western field (Figure 3).

The 'pond' area (Figure 3), which was to form an attenuation pond for the site, was watched during the visit of 13/07/01. Areas of gravel were observed, but were later found to be non-archaeological. The archaeological warden found more sherds of medieval pottery from a similar location to those discovered during previous visits. Finds were also recovered including a belt buckle, a sherd of Samian ware and flint flakes on the visits of 23-27/07/01 and also during the visits of 01/08/01 and 07/08/01, many from the from the metal detecting and surveying of Neil Glenister. The sewer trenches observed during these visits, however, did not yield any evidence of features or finds although they were up to 3-4 metres deep. No features were seen during the JCB training observed on these days. However, a few sherds of medieval pottery were recovered close to the 'pond' excavations during these visits and during the visit of 27/09/01.

The seven later visits in 2003 mainly involved the watching of the excavation of foundation trenches, although some topsoil stripping and service trenches were observed. The visits of 07-09/05/03 and 13-14/05/03 and 18/07/03 and 21/07/03 mainly involved the watching of foundation trenches for Plots 63-68. Despite the most interesting finds, including the two Roman brooches (Appendix 2) being located in this area no archaeological features were seen, although a few sherds of medieval pottery were located.

Conclusion

The watching brief yielded some significant finds, which suggests Roman activity in the area, along with some evidence of activity from the early medieval period. However, all the finds were located from within the topsoil and are therefore not clear evidence of activity taking place in any distinct areas of the site. Many were found close to field boundaries and close to the small stream, which runs across part of the site (Figure 3) and may have moved some distance from their point of origin.

The areas of apparent cobbling close to the field entrances are likely to be associated with the local farmer's attempts to consolidate areas that tended to become muddy and waterlogged during damp periods. This is endorsed by Neil Glenister who has observed this kind of activity throughout his association with the site and the local farmer.

The cobbled areas within the fields are also attempts to consolidate areas that are frequently used by farm machinery moving from field to field.

Only one feature was identified and excavated and that was the small post-hole seen during the visits of 05/07/01 and 06/07/01. This yielded no artefacts that would date it, but the proximity of the feature to the metalled surface just within the field entrance would suggest that this might have been the posthole for a gatepost, just within the middle field (Figure 3).

The watching brief uncovered no firm evidence for the line of the Roman Road, although the conditions under which the archaeological work was carried out was not conducive to good observational practice, as the site was not stripped systematically under close archaeological supervision.

The work of Neil Glenister in neighbouring fields to the study area have uncovered further finds, including a Roman 'Lion' decoration, a further 'Dolphin' brooch and part of a Roman knife pommel. The evidence for Roman activity in the area is strong, but unfortunately not specific.

Also of note is the relatively large quantity of medieval and post-medieval pottery covered from the watching brief (Appendix 1). Again no features were associated with these and it is likely that they are the result of manuring the fields over several centuries.

Archive

The archive for this project will be deposited with Leicestershire Historic and Natural Environment Team with accession number X.A35.2001 and consists of the following:

2000 Watching brief (Tim Higgins)

- 1 Copy of Final Report (ULAS 2000-86)
- 1 Watching brief recording sheet
- 2 Maps/sketches of site
- 2 Architect's Plans

2001-2003 Watching Brief (Steve Jones/Leon Hunt)

- 1 Copy Final Report (ULAS 2005-175)
- 18 Watching Brief Recording Sheets
- 2 Aerial Photographs (prints) of the Site, prior to the work
- 63 Colour Slides
- 1 B&W Contact Sheets with 30 prints
- 30 B&W Negatives
- 2 Architect's Plans
- 8 Maps and sketches of find locations

1 Box of Small Finds

A few finds discovered by Neil Glenister have been recorded with Leicestershire Historic and Natural Environment Team and are retained by Mr. Glenister in his private collection (see Appendix 2).

Acknowledgements

ULAS would like to thank the representatives of Cawrey Limited for their assistance. Steve Jones and Leon Hunt of ULAS would also like to thank Neil Glenister for his help, experience and co-operation on this project. Steve Jones, Jen Browning and Sally Ann Smith carried out the watching brief. Patrick Clay managed the project.

The Pottery and Miscellaneous Finds

Deborah Sawday

Introduction

The pottery, 102 sherds, weighing 912 grams, was examined under a binocular microscope and catalogued with reference to the ULAS fabric series (Davies and Sawday 1999), the results are shown below, Table 1. A small quantity of Roman tile, modern clay pipe and miscellaneous metal finds were also present.

Table 1: The pottery totals by fabric sherd numbers and weight (grams)

Discussion

The seven sherds of Roman pottery are evidence of activity in the area from the second to the fourth century AD. The twenty two sherds of Potters Marston ware, the single largest group of pottery from the site, date from the twelfth to the thirteenth centuries, and, together with the Coventry fabric CO2, Chilvers Coton fabrics CC1 and CC5, and the Medieval Sandy wares account for forty nine per cent of the total

assemblage by sherd numbers. There is a noticeable lack of late medieval pottery, and relatively little post medieval material.

Conclusion

There was limited evidence of a Roman presence in the area, presumably relating to the Roman road to the north. The relatively low average sherd weight and degree of abrasion of the fifty sherds of medieval pottery suggest that they are probably the product of the manuring of the fields with domestic rubbish from the twelfth, to the thirteenth and, possibly, the fourteenth centuries. The few sherds of later medieval and early post medieval pottery may point to changes in the patterns of rubbish disposal or possibly to changes in the pattern of the village settlement at the time.

Typically the medieval pottery fabrics reflect the essentially local nature of pottery production and distribution that characterised the industry in this period.

Table 3: Neil Glenister's finds by area (See Figure 4)

Neil Glenister's Finds: Miscellaneous (see Figure 4)

The following have been identified by Richard Knox of Leicestershire Museums (30/07/01). See Figure 5.

1. Roman Brooch. Dolphin type with leaf-shaped lobes along each side of the bow. A raised ridge incised on both sides and bearing tiny internal incisions runs down the middle of the bow. The spring is enclosed. The arms are plain with a slight ridge at the terminals. Catch-plate is partly broken and pin broken. Date: 1st-2nd century AD.
2. Roman Brooch. Mattat shows two brooches, which could be related. One is unassigned and has simple T-shaped pin bar arms but an ornate bow. The

other has similar arms and an elaborate bow but only for a short while until a wide fantail emerges. As your brooch is broken not far down the bow it is difficult to tell what the foot was like. Another possibility is that had a trumpet-brooch style foot.

3. A penny of Edward I. 1279. London Mint.
4. A foot ring from a Samian cup. Probably 2nd century AD.
5. A stone looking rather like worn Samian.
6. Two flint flakes with no subsequent working. Neolithic-Bronze Age

Plus: A modern silver pendant and a Victorian silver hat pin.

Figure 5: Illustration of Roman Brooches by R. Knox

APPENDIX 3: Design Specification for Archaeological work
