1 Executive Summary

- 1.1.1 An archaeological Trial Trench Evaluation was undertaken at Hunts Green Farm (Grim's Ditch Environs), Buckinghamshire (henceforth the 'Site'). The site code allocated for this work was 1C19HGFTT. The Site surrounds Grim's Ditch Scheduled Monument (List Entry 1021198), the archaeological investigation of which is covered by a separate Project Plan (Document Ref: 1EW03-FUS-EV-REP-CS03_CL05-009409).
- 1.1.2 The Site lies within Community Forum Area 10 (Dunsmore, Wendover and Halton) and is within Archaeological Sub-Zone (ASZ) 2: Land to the West of Hunts Green Farm including the Grim's Ditch Scheduled Monument (NGR 489270 203580, Figure 1).
- 1.1.3 The Site (C21023) lies off Kings Lane, 2km due north of Great Missenden, Buckinghamshire. The evaluation was targeted on land required for the main rail alignment, which in this section will be in a cutting, as well as associated engineering works that include environmental bunds and tree-planting alongside the cutting, as well as land needed for temporary soil storage areas as outlined in the Project Plan (Document Ref: 1EW03-FUS-EV-REP-CS03_CL05-009432). The evaluation followed the methodology laid out in the Location Specific Written Scheme of Investigation (Document Ref: 1EW03-FUS-EV-REP-CS03_CL05-000002).
- 1.1.4 The main purpose of the Trial Trench Evaluation was to investigate potential archaeological remains associated within the Site, including any possible extension or continuation of the Grim's Ditch Scheduled Monument. The Trenches were targeted on geophysical, cropmark and LiDAR imagery and blank areas, and were designed to investigate areas of Construction impact.
- 1.1.5 Of the 152 Trenches proposed for excavation in the Project Plan, a total of 151 Trenches were excavated. The excavation, recording and reinstatement of the Trenches was undertaken between 19th October and 3rd December 2020. There were 89 Trenches that revealed features of archaeological origin, although with varying quality of survival. One planned Trench (T72) was descoped from the main field and utilised within the area of Field 'H'. There were 12 Trenches moved from their original locations proposed in the Project Plan, as outlined in section 6.6 below.
- 1.1.6 Further small scale mitigation work was undertaken in April and July 2021 around two Trenches 135 and 142, subsequent to the main evaluation.
- 1.1.7 Further trial trenching took place within 'Field H', immediately adjacent to the eastern edge of the Site discussed in this report.
- 1.1.8 The evaluation revealed a possible extension to the probable Late Bronze Age/Early Iron Age Grim's Ditch monument and widespread remains of the late Iron Age and Romano-British period, with a rural settlement appearing to have become established in the decades preceding the Roman invasion. The Site appears to have been occupied for most of the Roman period. Numerous undated features were also present, as well as features of uncertain origin.

2 Project Background and Scheme Design

- 2.1.1 High Speed Two (HS2) is a new railway network proposed by Government to provide a link between London, the West Midlands, the East Midlands, South Yorkshire, Leeds and Manchester. Phase One of HS2 will involve the construction of a new railway approximately 230km (143 miles) in length between London and the West Midlands. Powers for the construction, operation and maintenance of Phase One are conferred by the High-Speed Rail (London - West Midlands) Act 2017.
- 2.1.2 The overall framework within which archaeological work will be undertaken is set out in the Environmental Minimum Requirements (EMR), the Heritage Memorandum, the Code of Construction Practice (CoCP) for HS2 Phase One and the GWSI: HERDS. Accordingly, the nominated undertaker or the Archaeological Contractor are required to implement appropriate and reasonable measures to identify, avoid or where practicable reduce impacts to the significance of heritage assets prior to the start of construction.
- 2.1.3 The Site is required for the rail alignment formation, which in this section will be in a cutting, as well as for associated engineering works that include environmental bunds and tree-planting alongside the cutting, together with land needed for temporary soil storage areas.

3 Site Location

- 3.1.1 The Site lies off Kings Lane, 2km due north of Great Missenden railway station, centred on NGR 489270 203580. It occupies high ground, with the Misbourne Valley, Woodlands Park and the A413 Aylesbury Road to the west and Hunts Green Farm and the buildings of The Lee village to the east (Figure 1).
- 3.1.2 The Site lies within Community Forum Area 10 (Dunsmore, Wendover and Halton) and is within Archaeological Sub-Zone (ASZ) 2: Land to the West of Hunts Green Farm including the Grim's Ditch Scheduled Monument (NGR 489270 203580).
- 3.1.3 The Site occupies a roughly rectangular plot of land comprising two arable fields, the Northern and Southern Fields, which are separated by a trackway leading from Hunts Green Farm. The Site occupies an area of 32.15ha (Fusion Site GIS ID Ref: C21023) and the fields were under arable cultivation during the works. The ground conditions were generally good, although the conditions worsened over the autumn-winter season, with areas of standing water becoming established in the Northern Field.
- 3.1.4 The Site surrounds the surviving earthworks of the Cottage Farm section of the Grim's Ditch Scheduled Monument (henceforth referred to as 'Grim's Ditch').

4 Site Geology and Topography

Geology

- 4.1.1 The underlying bedrock comprises chalk of the Lewes Nodular Chalk and Seaford Chalk Formations, formed approximately 84 to 94 million years ago in the Cretaceous Period in

HS2 Ltd., Code 1 Accepted

a local environment previously dominated by shallow seas. These are overlain by deposits of clay, silt, sands and gravels of the Clay-with-Flints formation which were laid down up to 23 million years ago, (BGS 2020). This is consistent with what was encountered during the evaluation.

- 4.1.2 Soils are described as well-drained flinty fine silty soils, over chalk or chalk rubble on the valley sides varying to well drained fine silty or loam, and variably flinty over chalk (Cranfield Online 2020).

Topography

- 4.1.3 The Site occupies relatively level high ground, at between approximately 190-200m above Ordnance Datum (aOD).

Previous Disturbance

- 4.1.4 There is little indication that the Site has undergone significant disturbance, for example, there is no sign of quarrying within the area that was evaluated. There is likely to have been some limited impact from agricultural ploughing from the medieval period to the present.

5 Previous Works

- 5.1.1 A Project Plan detailing the scope, aims and methodologies required to address specific GWSI: HERDS research objectives identified as being applicable to this Site was prepared for the works; *Project Plan for Trial Trench Evaluation at Hunts Green Farm (Grim's Ditch Environs), Buckinghamshire (AC210/15)* (Document no: 1EW03-FUS-EV-REP-CS03_CL05-009432).
- 5.1.2 A Location Specific Written Scheme of Investigation detailing the methodology, deliverables, programme, health, safety and environmental requirements, resources and interfaces necessary to deliver the archaeological evaluation was prepared for the Site; *Location Specific Written Scheme of Investigation for Archaeological Trial Trenching at Hunts Green Farm (Grim's Ditch Environs), Buckinghamshire (AC210/15)* (Document no: 1EW03-FUS-EV-REP-CS03_CL05-000002).
- 5.1.3 An Environmental Statement (CH-001-010 ES 3.5.2.10.4) was prepared in 2013, part of this was to provide an evidence base against which the assessment of assets that may be affected by the construction of the Proposed Scheme could be made. It contained information about known and potential heritage assets from a variety of sources and presented a chronological description and discussion of the development of the study area, placing assets within their historical and archaeological context. Other than the Scheduled Monument of Grim's Ditch (List Entry 1021198), no designated heritage assets were recorded within the Site. A further earthwork bank and parish boundary are recorded within the Site. Nearby heritage assets are also recorded in concentrations to the east of the Site in the vicinity of Hunts Green Farm and to the west in the vicinity of Cottage Farm, mostly consisting of findspots spanning multiple periods.
- 5.1.4 The Environmental Statement included the results of a remote sensing survey of the Site and its environs. The remote sensing survey included the interpretation of aerial photographs, hyperspectral imagery and LiDAR imagery. The LiDAR data confirmed the

presence of the Grim's Ditch earthwork along with a possible continuation within the Site, as well as areas of ridge and furrow immediately adjacent on the western side of the monument, approximately 75m to the south and 350m to the east. Other features identified included field boundaries (to the north) and possible quarries on the eastern side of the monument.

- 5.1.5 As part of the HS2 works, a geophysical survey was also undertaken across the Site (Doc Ref: C252-ETM-EV-REP-020-000263_P02). The geophysical survey results identified various linear and discrete features, some of which were deemed to likely be of archaeological origin.

6 Aims and Specific Objectives

- 6.1.1 The full aims and objectives for the archaeological trial trenching can be found in Section 3 of the Project Plan. Trial trench investigation provides the most suitable method for the recovery of archaeological evidence to inform the research objectives. Section 4 of the Project Plan provides a methodology and deliverables for the trial trench evaluation.

6.2 General Aims

- 6.2.1 The aims of the trial trenching were to:

- Provide a record of the Site prior to any impact from the HS2 scheme
- Confirm the presence/absence, extent and depth of any surviving archaeological remains within the Site
- Determine the nature, date, condition, state of preservation including any preservation bias, complexity and significance of any archaeological remains
- Determine the likely range, quality and quantity of artefactual and environmental evidence present
- Suggest measures, if appropriate and feasible, for further archaeological investigation to mitigate identified significant impacts, and
- Contribute to the delivery of GWSI: HERDS Specific Objectives as specified in Section 4.2 of the project plan.

6.3 Specific HERDS Objectives

- 6.3.1 The trial trenching was required to help clarify the location, extent, survival and significance of any heritage assets in the vicinity of the Site and will contribute to the following specific GWSI: Historic Environment Research and Delivery Strategy (HERDS) objectives, as detailed in the Project Plan:

- KC2: Explore the location of Palaeolithic deposits, reconstruct past environments and investigate the relationship between climate variation and phases of human activity.
- KC5: Identifying settlement location and developing models for settlement patterns of the Mesolithic, Neolithic and Early Bronze Age.

- KC6: Understanding the evidence for change in the environment and management of the landscape for the Mesolithic and Early Neolithic periods.
- KC13: What was the date of the establishment of Grim's Ditch? What impact did it have on the landscape following its construction?
- KC15: Can we identify regional patterns in the form and location of Late Bronze Age and Iron Age settlements across the route, and are there associated differences in landscape organisation and enclosure?
- KC16: Investigate the degree of continuity that existed between Late Bronze Age and Iron Age communities in terms of population, mobility and subsistence strategies.
- KC18: Explore the evidence for increasing social complexity in the archaeological record in the Late Bronze Age and Iron Age and identify patterns of intraregional and regional variation.

6.4 Scope

- 6.4.1 The trial trench evaluation of the Site was undertaken in October to December 2020. Of the 152 Trenches proposed for excavation in the Project Plan, a total of 151 Trenches were excavated. In the Northern Field, 78 (of 79 planned) Trenches were 30 x 1.8m, eight were 50 x 1.8m and one was 80 x 1.8m. Within the Southern Field, 64 Trenches were 30 x 1.8m. One Trench in the Northern Field, Tr 72, was not excavated due to access issues. The excavation of this Trench was descoped from the main field and utilised in Field 'H' undertaken at a later date, under the existing Project Plan. Thirteen Trenches were moved through change control.
- 6.4.2 Within the Northern Field, nine Trenches (21, 29, 31, 35, 40, 45, 52, 54 and 66) were positioned on a possible continuation of Grim's Ditch, while the 80m long Trench (Trench 66) targeted a possible T-shaped field boundary as well as any possible continuation of Grim's Ditch and associated relationships between the two. The remaining Trenches were targeted on a mix of geophysical/LiDAR anomalies and blank areas. All the Trenches within the Southern Field targeted a combination of geophysical/LiDAR anomalies and blank areas.
- 6.4.3 A contingency trenching of up to a 1% sample (equivalent of 15 No. 30 x 1.8m Trenches) of trenching was available, subject to approval by the Contractor, if further clarification of the archaeological remains was considered necessary to meet the aims of the evaluation.
- 6.4.4 During the investigation of two trial Trenches, 135 and 142, features were identified that were deemed to benefit from some small-scale additional excavation. Two 20m x 20m areas were subsequently agreed upon to investigate the remains identified during 2021 works.
- 6.4.5 A total of 453 test pits were excavated within the footprint of the evaluation Trenches to recover unstratified artefacts from the topsoil through sieving. These comprised three test pits per Trench.

6.5 Methodology

- 6.5.1 The trial trench evaluation was undertaken in accordance with the Technical Standard Specification for historic environment investigations (HS2-HS2-EV-STD-ooo-000035) and the GWSI: HERDS (HS2-HS2-EV-STR-ooo-000015), and the Project Plan for Trial Trench Evaluation at Hunts Green Farm (Grim's Ditch Environs), Buckinghamshire (AC210/15).
- 6.5.2 The fieldwork followed the Standard and Guidance: Archaeological Evaluation (ClfA 2014a), the Management of Archaeological Projects 2 (English Heritage 1991), the Management of Research Projects in the Historic Environment (MORPHE): Project Managers' Guide (Historic England 2015) and the Technical Standard Specification for historic environment investigations (HS2-HS2-EV-STD-ooo-000035).

Artefact Recovery

- 6.5.3 Prior to mechanical excavation, each Trench was sampled for unstratified artefacts within the topsoil through the excavation of three test pits per Trench (Figures 13, 14, 15 and 16) as outlined in the Project Plan. Each sample was 125 litres, the equivalent of a 0.25m square test pit and was passed through a 6mm sieve in order to recover any artefacts.

Setting-out

- 6.5.4 All spatial setting out and recording was undertaken in accordance with The Ordnance Survey National Grid and Ordnance Survey Newlyn Datum (ODN) as defined by the OS Active Global Navigation Satellite System (GNSS) network and use of a Virtual reference system.
- 6.5.5 Trenches were located to a horizontal accuracy of +/-500mm with surface levels recorded to an accuracy of 10mmÖk: where 'k' was the total distance levelled in kilometres.

Machine Excavation

- 6.5.6 Trenches were excavated to either the first archaeological horizon or the natural substrate, whichever was reached first, using a mechanical excavator fitted with a toothless bucket.
- 6.5.7 Each machine was under the constant supervision of a suitably trained, competent and experienced archaeologist.
- 6.5.8 A CAT scanner was used at each 300mm excavated spit to ensure no unidentified buried services were present.
- 6.5.9 Topsoil and subsoil were stripped independently and stored separately on either side of the Trench, as per the Technical Standard: Route Wide Soil Resource Plan (HS2-HS2-EV-STD-ooo-000008).

Fieldwork Recording

- 6.5.10 A sufficient sample of each feature was excavated to meet the requirements of the GWSI: HERDS.
- 6.5.11 Archaeological recording comprised:

- at least one representative section at 1:20 scale of each evaluation Trench, from ground level to the base of the excavation
- the written record of individual context descriptions on appropriate pro-forma
- photographs with details recorded in a photo-register
- linear features identified within the Trenches were 50% or 20% excavated, discrete features 50% excavated
- section drawings of features were made at 1:20 and 1:10 as appropriate

6.5.12 A 'Site location plan', indicating Site north was prepared at 1:1250:

- individual 'Trench plans' were prepared at 1:100
- the location of site plans was identified using OSGB coordinates

Environmental Sampling

6.5.13 In line with the Employer's Technical Standard Specification for Historic Environment Investigations (HS2-HS2-EV-STD-ooo-000035) the following sampling strategy was implemented:

- Archaeological features (pits, boundary ditches and paleochannels)
- Deposits representing the main phases of activity on Site (to assess whether there were changes in rates of deposition, or material survival over time)
- Samples were taken to provide dating, palaeo-environmental and site formation information

6.5.14 Samples were taken using ten litre plastic buckets (with lids and handles), for the recovery of bulk 'disturbed' environmental samples. Labelling followed the guidance set out in the Technical Standard Specification for Historic Environment Investigations (HS2-HS2-EV-STD-ooo-000035).

Backfilling

6.5.15 Once recording was completed, following HERDS Manager approval the Trench was backfilled in reverse order (subsoil first then topsoil) and the ground made good.

6.6 Change Control

6.6.1 The relocation of 13 of the excavated Trenches from their original locations proposed in the Project Plan was implemented through change control, due either to proximity to monitoring boreholes or to the trackway installed to access the compounds on Site which had to follow ground contours.

6.6.2 Where these Trenches targeted geophysical anomalies they were adjusted to target the same anomalies, and maintain approximately the same orientation, given constraints of the Site:

- Trench 3 was moved 5m to the southeast on the same alignment as it lay beneath the trackway and a safe working margin was required (Document number TBC)

- Trench 6 was rotated approximately 10 degrees clockwise to be parallel to the trackway (Document number TBC)
- Trench 16 was moved 3m to the north to avoid the trackway (Document number TBC)
- Trench 24 was moved to the northeast to avoid the trackway (Document number TBC)
- Trench 32 was rotated approximately 10 degrees anticlockwise to be parallel to the trackway (Document number TBC)
- Trench 44 was initially rotated 90 degrees anticlockwise and positioned to the west of the trackway, but this was too close to the utilities exclusion zone and it was thus relocated further to the east of the trackway (Document number TBC)
- Trench 51 was moved 2m to the north, but remained on the same alignment to maintain a sufficient margin of safety between the INFRA compound and the Trench (Document number TBC)
- Trench 53 was moved 3m to the south to avoid both the trackway and equipment (Document number TBC)
- Trench 61 was rotated approximately 10 degrees anticlockwise to be parallel to the trackway (Document number TBC)
- Trench 72 was overlain by the compound installed for the Coombes tree felling and although the Trench was postponed until remobilisation in the new year 2021 it was eventually descoped and the equivalent area utilised as part of the Field H works. The Trench was targeting the same geophysical anomaly as in Trench 58 and it would not affect the decision-making process for the Site but will be included in the final report for the trial trenching work of Hunts Green (Document number TBC)
- Trench 88 maintained approximately the same orientation, but the southwest end was moved 2m to the east for clearance away from monitoring boreholes, while still avoiding the utilities exclusion zone (Document number TBC)
- Trench 129 maintained the same orientation but moved southeast by 6m for clearance away from monitoring boreholes, to still avoid the utilities exclusion zone to the northwest (Document number TBC)
- Trench 135 was subject to a 20m x 20m expansion area centred on its location to further investigate features identified (Document number TBC)
- Trench 142 was subject to a 20m x 20m expansion area centred on its location to further investigate features identified (Document number TBC)
- Trench 146 maintained the same orientation but was moved north-eastward by approximately 2m to avoid monitoring boreholes (Document number TBC)

7 Results of Trial Trench Evaluation

7.1 Geological Sequence

- 7.1.1 The general absence of subsoil observed within most of the Trenches demonstrates the Site has been truncated by ploughing, with 0.3m thick topsoil directly overlying the natural clay-with-flints geology for most of the area. The only intermittent areas of subsoil present were either preserved in the depressions of underlying archaeological features or towards the southeast, where the ground began to slope downhill.

7.2 Archaeological Results

Test Pitting and Metal Detecting Archaeological Results (Figures 14-17)

- 7.2.1 The 453 test pits (Figures 14-17) only recovered a limited array of unstratified artefacts, which included pottery and CBM predominantly of post-medieval date. A small number of Prehistoric struck flints was also recovered dispersed between several test pits across the Site. The vast majority of the test pits (419) produced no artefacts at all and no notable concentrations that warranted immediate further investigation were identified. Similarly, prior to detailed analysis, no results from any single test pit were sufficiently significant to warrant individual discussion.
- 7.2.2 Metal detecting within the footprint of each Trench recovered a total of 38 artefacts from the topsoil across the Site. There were no notable scatters of metallic artefacts to indicate that further investigation would be required. The only firmly dateable objects were of post-medieval or modern date. The majority of recovered objects were of copper alloy, although three silver artefacts were also recovered, two post-medieval/modern coins and a ring of uncertain date.

Trial Trench Evaluation Archaeological Results (Figures 2-10, 2a-2j)

- 7.2.3 Of the 152 Trenches proposed for excavation in the Project Plan, a total of 151 Trenches were excavated, with the remaining Trench (T72) to be excavated at a later date. For the purposes of recording, the Site was divided into two fields, the Northern Field and the Southern Field. Archaeological features were found in 89 of the excavated Trenches. A further nine Trenches contained features that were thought to be of probable archaeological origin. The archaeological features were scattered relatively densely across parts of the Site, most notably within the Northern Field. Typically, features within the Southern Field were more difficult to interpret as definitely archaeological, as described in Table 1 below. While there were a number of features in this field that were confidently interpreted as being of archaeological origin, with numerous others it was unclear within the confines of the evaluation Trenches whether they were formed through archaeological or natural processes. There were also some notable areas within the Site that appeared more or less devoid of features, at least within the footprint of the evaluation Trenches. Numerous natural/bioturbation features were identified, particularly within the Southern Field.

- 7.2.4 The following section contains a description of the features and deposits excavated during the evaluation and should be read in conjunction with Appendix 3, which provides detailed descriptions and stratigraphic information for each deposit and cut feature.
- 7.2.5 The results of the Trenches containing features are discussed below, in numerical order. For the purposes of this report, the conclusion will discuss the results thematically and chronologically.
- 7.2.6 A summary of the findings is in Table 1, below.

Table 1 Summary of findings

Category	Description	Trench No.	Total No.
B - Blank	Trenches contained no features, or only land drains	1, 3, 23, 29, 37, 46, 57, 71, 74, 75, 76, 80, 85, 86, 87, 89, 92, 94, 95, 96, 100, 101, 121, 128, 133, 137, 144	27
N - Natural	Trenches had features which were investigated and determined to be of Natural origin, either rooting or geological.	5, 10, 12, 14, 17, 28, 32, 49, 56, 64, 77, 81, 84, 91, 102, 103, 104, 112, 114, 116, 117, 119, 120, 125, 127, 129, 130, 131, 132, 138, 139, 140, 143, 145, 147	35
L – Low Significance	Trenches had features which were investigated and were either: of ambiguous origin, but probably natural; single isolated, undated discrete features; or single post-med features.	16, 24, 30, 54, 63, 65, 79, 83, 88, 105, 106, 107, 108, 109, 110, 113, 115, 123, 151	19
M – Moderate Significance	Trenches had features which were investigated and there were several features of possible archaeological origin, with only poor or no finds assemblages.	4, 6, 18, 21, 22, 26, 33, 34, 35, 36, 39, 41, 42, 44, 45, 47, 48, 50, 51, 52, 53, 58, 62, 68, 69, 70, 78, 82, 90, 93, 97, 99, 111, 118, 122, 124, 126, 134, 136, 141, 146, 148, 149, 150, 152	45
H – High Significance	Trenches had features which were of archaeological origin.	2, 7, 8, 9, 11, 13, 15, 19, 20, 25, 27, 31, 38, 40, 43, 55, 59, 60, 61, 66, 67, 73, 98, 135, 142	25

Trench 002 (figures 2, 18, 59 and 98; plate 1)

- 7.2.7 Two undated post holes were recorded within Trench 002. Post hole [900203] was oval in plan, and truncated bioturbation (900202). It survived to a depth of 0.14m and contained a single fill (900204). Probable post hole [900205] was only partially exposed in plan and partly obscured beneath the northern baulk, but it was sufficiently visible to properly excavate and appeared circular, with steep sides, a concave base and an overall depth of 0.36m. It also contained a single fill (900206), with a notable concentration of unworked flint towards the base, possibly the remnants of packing stones.
- 7.2.8 A ditch [900210], aligned approximately north-east – south-west was also identified, although this feature was notably disturbed through bioturbation. It had moderately

HS2 Ltd. Code Accepted

sloping sides with a concave base and contained a single fill (900209) which yielded an assemblage of worked flint. A Prehistoric end scraper and Late Iron Age/Early Roman pottery was recovered from context (900208), the fill of ditch [900207] (Plate 1) truncated by [900210].

Trench 004 (figures 2, 18, 59 and 98)

- 7.2.9 A linear ditch terminal [900407] was identified towards the north-western end of Trench 4, measuring up to 0.61m wide and 0.36m deep. It contained a single, undated fill (900408). Another terminal [900409], was located immediately north-west of [900407]. It was slightly smaller, measuring 0.32m wide and 0.12m deep, and contained a similar, undated silty clay fill (900410).
- 7.2.10 Trench 004 also contained a possible pit or terminal [900405] which was only partially visible from beneath the eastern Trench baulk, although sufficiently exposed to properly evaluate. It had irregular sides and a concave base and where exposed, was 0.44m wide and 0.36m deep. It did not contain any dateable artefacts.

Trench 005 (figures 2, 18, 59 and 98)

- 7.2.11 Within Trench 005, the possible base of a truncated pit or post hole [900502] was recorded toward the north-eastern end of the Trench. It was sub-circular in plan and measured 0.72m in length, 0.38m in width and 0.16m in depth. A single fill (900503) was present, from which broadly dated Prehistoric worked flint was recovered (see section 8.3).

Trench 006 (figures 2, 19, 60 and 98)

- 7.2.12 Trench 006 contained a possible pit [900603] which was sub-circular in plan, with steeply sloping concave sides and base and which measured 1.4m long, 1m wide and 0.47m deep. It was reasonably well-defined and contained a single homogenous and sterile fill (900604).
- 7.2.13 A bioturbation related feature was also recorded [900605]/(900606).

Trench 007 (figures 2, 19 60 and 98; plate 2)

- 7.2.14 A substantial ditch [900702] (Plate 2) was investigated within Trench 007 and appeared to be a continuation of the ditch also seen in Trenches 013, 020, 025, 031, 040 and 052. It measured 5.66m in width and was at least 1.2m in depth, the base having not been reached as it was beyond the safe limit of excavation. The sides were generally steeply sloping but slightly irregular. It contained a series of fills which, from the lowest exposed, were (900703), (900704), (900705), (900706), (900707), (900708), (900709), (900210) and (900713). Finds were recovered from various fills, including Roman pottery spanning the 1st to 3rd centuries AD from (900703), (900706), (900708), (900709), (900710), while a reasonable assemblage of slag, including two smithing hearth bottoms and vitrified hearth lining, were recovered from upper fill (900709). Sample <700> also contained evidence of metal working (see 8.6 and Appendix 9, Table 26) This suggests that the remnant of surviving ditch earthwork was used as a convenient hollow in which to dump metal-working debris during the Roman period. Fill (900708) was also notable in that it contained a fragment of a sword or spear, dated broadly to the Late Iron Age or Roman period. Other fills appeared to represent episodes of silting after the ditch had fallen out

of use, the accumulation of Roman pottery likely being the result of nearby occupation during this period.

- 7.2.15 The upper fills of ditch [900702] were truncated by a smaller ditch [900711] which was flat based and with steep, flat sides. It was 0.18m wide and 0.2m deep and contained a single fill (900712) that yielded no dateable artefacts.
- 7.2.16 A Roman copper alloy finger ring was also recovered from topsoil (900700) through metal detecting.

Trench 008 (figures 2, 19, 60 and 98; plate 3)

- 7.2.17 Several features of note were recorded within Trench 008. Ditch [900802] was located at its northern end in a north-west – south-easterly alignment and measured 1.1m wide and 0.37m deep. It contained a single fill (900803) from which pottery of broad Roman date was recovered.
- 7.2.18 Appearing to run parallel to ditch [900802] was a possible wide ditch or hollow-way [900804] (Plate 3). Two fills were present within the hollow-way, (900805) and (900806), the composition of which suggested they had accumulated naturally under relatively wet conditions. Both contained pottery of 1st century AD Roman date while animal bone was also recovered from the lower fill (900805).
- 7.2.19 Ditch [900807] was situated close to the south-western end of the Trench and also appeared to run parallel to ditch [900802]. It had concave, but irregular sides and base, surviving to an overall width of 0.7m and depth of 0.08m. A single sherd of late C1-C3rd pottery was recovered from the only fill (900808).
- 7.2.20 A large irregular and amorphous feature or possible spread [900809] was located to the north-east of ditch [900807]. Where investigated, it appeared to have steep sides and a flat base, to a depth of 0.2m. A single fill (900810) was identified, which contained abundant inclusions of angular flint of varying sizes as well as Roman pottery dated to AD 50-70.
- 7.2.21 The final feature was a ditch [900811] which truncated [900809]/(900810) and on the same alignment to ditches [900807] and [900802]. It contained a series of four fills (900812), (900813), (900814) and (900815) which yielded pottery which spanned much of the Roman period, most notably from (900814).

Trench 009 (figures 2, 20, 61, 62 and 98; plate 4)

- 7.2.22 A single undated ditch [900902], aligned approximately east-west, was identified cutting the natural substrate. It had gently sloping, slightly convex sides and a concave base and measured up to 0.92m wide and 0.27m deep. It contained a single fill (900903).
- 7.2.23 A sub-circular pit [900904] (Plate 4) was partially exposed against the southern Trench baulk. It had steep sides and a flat base, with a maximum exposed width of 2.56m and depth of 0.35m. Two of the fills identified within the pit (900906) and (900907) both appeared to be deliberate dumps of domestic refuse such as pottery, perhaps indicating habitation nearby. The profile of the pit was stepped and became notably wider at the very top of the cut and appeared to contain a deliberately constructed or dumped unworked flint layer (900905) of 3.3m wide and 0.36m deep which lay directly below the

topsoil. The purpose of this was not immediately clear, although it was observed that fill (900906) was particularly clay-rich, perhaps forming a bedding layer onto which (900905) could be placed. The pottery recovered from the pit was of broad Roman date.

Trench 010 (figures 2, 20, 61 and 98)

- 7.2.24 Two parallel linear features [901002] and [901004] which were interpreted as cultivation furrows were recorded within Trench 0010. They were both aligned approximately north-east – south-west and contained single fills (901003) and (901005) respectively. Their relatively close proximity to one another suggests they were perhaps originally of post-medieval date rather than medieval, with fragments of plastic (not retained) seen within fill (901005) suggesting they were ploughed flat in the relatively recent past.

Trench 011 (figures 2, 20, 62 and 98; plate 5)

- 7.2.25 An irregular deposit (901102) of up to 0.1m thickness was recorded within Trench 11. The full length of this deposit was not exposed but it measured up to 2.7m wide. There was no discernible cut and it appeared as a thin occupation-type layer of very dark greyish brown silty clay. A small number of Roman pottery sherds dated AD 50-70 and fired clay were recovered from the excavated intervention.
- 7.2.26 Pit [901103] was located centrally within the Trench and was partially covered by the southern Trench baulk. It had steeply sloping, convex sides which became near vertical towards the flat base, and it measured 1.52m wide and 0.63m deep. It contained four fills (901104), (901105), (901106) and (901108). The earliest two (901104) and (901105) and uppermost (901108) were visibly charcoal-rich and likely the result of deliberate dumps of possibly industrial waste. Heat-affected stones and slag were recovered from (901105) and (901108). Fill (901106) was thought to be a secondary fill formed through natural silting, perhaps marking a period when the pit was open but not in direct use for waste disposal.
- 7.2.27 A second pit [901110] (Plate 5) was sub-circular in plan, with slightly stepped sides and a flat base. It was up to 1.5m in width and 0.44m in depth, although it was not fully exposed in plan. It contained a series of three fills (901111), (901112) and (901113) which all appeared to be deliberate dumps of industrial and domestic waste. A well-preserved cattle tibia was recovered from (901113).

Trench 012 (figures 2, 21, 63 and 98)

- 7.2.28 Two undated post holes [901202] and [901204] were present within the Trench. Both contained single fills with the noted presence of irregular flints, perhaps the remnants of packing stones. There was no evidence of post-pipes in either post hole, suggesting the posts had been intentionally removed rather than degrading in situ.

Trench 013 (figures 2, 21, 63 and 99; plate 6)

- 7.2.29 Contained within Trench 13 was a substantial ditch which appeared to be a continuation of that encountered in Trenches 007, 020, 025, 031, 040 and 052. There appeared to be two phases present within this part of the ditch: the original cut [901305] and later re-cut [901307]. The earlier cut [901305] appeared to be up to 10.85m wide with moderately sloping sides, while the narrower re-cut was a smaller 5.27m. Fill (901306) of the earlier ditch contained pottery of AD 120-200 date.

- 7.2.30 Recut [901307] (Plate 6) had steeply sloping, slightly concave sides but the base was not reached due to the excavated depth below present ground level (bpgl). Within the excavated intervention, three secondary fills were noted (901308), (901309) and (901310) and pottery of C1st date was recovered.
- 7.2.31 Small gully [901311] was located at the far eastern end of the Trench, the fill of which (901312) contained pottery of first century date.

Trench 014 (figures 2, 21 and 99)

- 7.2.32 A single area of bioturbation [901402] was recorded.

Trench 015 (figures 2, 22, 64 and 99; plate 7)

- 7.2.33 Two features of note were recorded within Trench 15. A possible track-way [901505] was located broadly in the centre of the Trench, aligned approximately north-east – south-west. It measured 3.34m wide and 0.14m deep and contained a single fill (901506). No finds were recovered.
- 7.2.34 Additionally, feature [901507] (Plate 7) was aligned broadly east-west and appeared slightly curvilinear in plan. Although recorded as a probable ditch, it had an obvious undercut ‘bell-shaped’ profile with a flat base more reminiscent of a large storage pit, and the possibility remains that it is a large pit rather than a ditch, particularly as it does not appear to continue into any adjacent Trenches. The sequence of fills (901508) to (901512) was characterised by a series of secondary silting episodes and intentional dumping of domestic waste, including Roman pottery.
- 7.2.35 A bioturbation related feature [901502] was also recorded.

Trench 016 (figures 2, 22, 64 and 99)

- 7.2.36 Three possible postholes [901602], [901604] and [901608] were identified although it was not certain if they were archaeological or the result of bioturbation. All contained single fills (901603), (901605) and (901609) and were undated.

Trench 017 (figures 2, 22, 64 and 99)

- 7.2.37 A single naturally formed feature [901702] was recorded.

Trench 018 (figures 2, 23, 64 and 99)

- 7.2.38 Pit [901803] was sub-circular in plan with concave sides and base and was up to 0.72m wide and 0.15m deep. It had a single fill (901804) which although undated, did contain a fragment of slag and charcoal, suggesting perhaps a dump of metalworking waste.
- 7.2.39 Pit [901805] was of broadly similar dimensions to [901803] and similarly shallow. It also contained a single undated fill (901806).
- 7.2.40 The Trench also contained a narrow gully [901807] that was up to 0.32m wide and 0.15m deep. It was aligned approximately north-east – south-west, with concave but asymmetrical sides and a concave u-shaped base. It contained a single fill (901808) but no dateable artefacts.

Trench 019 (figures 2, 23, 65 and 99)

- 7.2.41 A single gully [901902], aligned approximately north-east – south-west, was encountered within the central part of the Trench. It had steeply sloping, slightly convex sides and a slightly concave base. It contained a single fill (901903) from which Late Iron Age/Early Roman pottery was recovered.

Trench 020 (figures 2, 23, 65 and 99; plate 8)

- 7.2.42 The most notable feature within Trench 020 was a continuation of the substantial ditch seen in Trenches 007, 013, 025, 031, 040 and 052. Within Trench 020 it measured up to 8m wide, with excavation ceasing at a depth of 0.9m due to safety considerations, the base having not been reached. Similar to the same feature in Trench 013 to the north, at least two phases of activity were also identified in Trench 020, with the initial ditch construction [902007] and a later re-cutting [902017] (Plate 8). Within the earlier cut, undated primary and secondary fills were recorded (902008) and (902009) as well as two undated tertiary fills (902014) and (902015). A possible intermediate recutting was also potentially identified as [902016], filled by (902013), although this is not certain. The main recut [902017] contained a sequence of three fills (902010), (902011) and (902012) which contained Roman pottery of C1-C2nd date as well as Roman CBM. Fill (902010) also contained metal-working slag, including vitrified hearth lining.
- 7.2.43 Two additional, less substantial ditches were also recorded. They were parallel to one another as well as ditch [902007], being aligned broadly north-south. Ditch [902002] was 1.1m wide, 0.65m and had moderately sloping, concave sides and base. It contained two undated fills, primary fill (902003) and secondary fill (902004).
- 7.2.44 Ditch [902005] was smaller, with a width of 0.4m and depth of 0.2m but had a similar profile. It contained a single, sterile fill (902006).

Trench 021 (figures 2, 56, 66 and 99)

- 7.2.45 Feature [902102] appeared to be a narrow gully, although a definite interpretation was hindered by the fact that the feature was heavily disturbed through bioturbation. It had gently sloping sides and a concave base up to 0.34m deep. Two undated fills (902103) and (902104) were noted.
- 7.2.46 Ditch [902105] measured 1.4m wide and 0.5m deep with moderately sloping sides and a slightly irregular base. It was aligned north-north-west – south-south-east. It contained a single undated fill (902106)/(902107). The ditch appeared to potentially be recut as [902113], within which two further fills were identified, (902108) and (902109). Neither contained any dateable objects.
- 7.2.47 A further ditch [902110] was identified approximately 5m east of [902105]/[902113]. It had a clearly defined profile with steep, near vertical sides and a flat base. It measured 0.76m in width and 0.48m in depth and contained two fills, the upper of which (902111) contained a sherd of Roman pottery.

Trench 022 (figures 2, 24, 66 and 99)

- 7.2.48 Trench 022 contained a series of five heavily truncated post holes [902202], [902206], [902208], [902210] and [902212]. All contained single fills (902203), (902207), (902209), (902211) and (902213) that were undated.

- 7.2.49 Shallow terminal [902204] was aligned north - south and had asymmetrical concave sides and a concave base. It measured 0.58m wide and 0.15m with a single undated fill (902205).

Trench 024 (figures 2, 24 and 99)

- 7.2.50 Two features of natural origin [902402] and [902404] were present.

Trench 025 (figures 2, 24, 66 and 100; plate 9)

- 7.2.51 As with Trenches 007, 013, 020, 031, 040 and 052, Trench 5 contained a continuation of the substantial ditch, and although there were multiple ditches on the correct projected line, it is thought that the most substantial [902508], represented a continuation of the feature seen in the other trenches.
- 7.2.52 The large ditch [902508] was approximately 7m wide and had a depth of at least 1m. In section it appeared to be truncated by a later ditch [902512] (Plate 9) which contained a series of four fills (902513), (902514), (902509) and (902510). The lowest exposed fill (902513) contained Roman pottery. Fill (902510) contained a quantity of metal working debris, including two incomplete furnace bottoms, tap slag and a single hammerscale sphere. Although very limited evidence, this suggests that both smelting and smithing were taking place within the vicinity. Ditch [902512] also truncated ditch [902515] to the west and ditch [902502] to the east.

- 7.2.53 Ditch [902515] contained a single fill (902516) which was truncated by two further undated gullies [902517] and [902519] which were sealed immediately below the topsoil. These gullies represent the latest phase of activity within the Trench, with [902517] also truncating the western edge of [902508].

- 7.2.54 Ditch [902504] was 3.45m wide and 0.57m deep. It contained two undated fills (902505) and (902506) and was truncated by a later ditch [902502].

- 7.2.55 Ditch [902502] was 1.3m wide, 0.33m deep and had steeply sloping convex sides and a concave base. It contained a single fill (902503) contained an assemblage of Roman pottery and slag, suggesting industrial activity nearby. It was truncated on the western side by ditch [902512].

Trench 026 (figures 2, 25, 67 and 100)

- 7.2.56 A possible beam slot [902602] was recorded within Trench 026, aligned approximately north-west – south-east. It had very steep, flat sides and a flat base with a recorded depth of 0.22m and width of 0.2m. Approximately 0.5m of the gully was exposed in plan, ending in a well-defined and squared off terminal. It contained a single undated fill (902603).
- 7.2.57 Ditch [902608] measured 0.65m in width and 0.33m in depth, aligned approximately north-east – south-west. It had concave sides and base and contained a single, undated fill (902609).
- 7.2.58 Immediately adjacent to [902602] was an undated linear [902604] which measured at least 0.45 m long, 0.22m wide and 0.1m deep. Both features truncated earlier ditch [902608].

- 7.2.59 Towards the western end of the Trench was ditch [902606]. It had a V-shaped profile and was 1.35m wide and 0.63m deep. It contained a single secondary fill (902607) but no dateable artefacts.

Trench 027 (figures 2, 25, 67 and 100; plate 10)

- 7.2.60 An irregular stone surface (902703) was recorded contained within a shallow cut [902702]. It was approximately 13.7m at its widest extent and the overall depth of the cut was 0.69m. The surface itself consisted of well packed flint nodules and smaller stones, perhaps to create a working area or to consolidate wet ground. It did not appear to continue into any adjacent Trenches and so is likely to be a relatively discrete area. Surface (902703) was itself undated, but it was immediately overlain by an occupation deposit (902704) also contained within cut [902702] which yielded abundant late 3rd century Roman pottery and CBM as well as the most notable assemblage of worked flint from the Site, comprising 41 small pieces, mostly recovered through environmental sampling. A Roman silver earring of 3rd Century date and a steelyard weight were also recovered from the same deposit. This deposit was in turn overlain by two successive silting deposits (902705) and (902706) which did not contain any finds, presumably representing the period after the surface had fallen out of use.
- 7.2.61 Cut [902702] appeared to truncate two earlier features, [902707] and [902712]. Ditch [902707] was aligned approximately north – south and had moderately sloping concave sides and base and was up to 1m deep. It contained a series of fills, one of which (902710) may have been a deliberate dump that contained large stones and C1st Roman pottery.
- 7.2.62 Feature [902712] (Plate 10) was more irregular in plan and was thought to be a possible pit or ditch. It was 3.1m wide and 0.74m deep with irregular sides and base. One fill (902714) contained C1st Roman pottery.

Trench 028 (figures 2, 25, 67 and 100)

- 7.2.63 Two natural features were recorded, [902802] and [902804].

Trench 030 (figures 2, 26 and 67)

- 7.2.64 Possible pit [903002] was oval in plan with gently sloping concave sides and base. It was 0.97m in length, 0.41m in width and 0.19m in depth. A single undated fill (903003) was identified.

Trench 031 (figures 2, 56, 68 and 69; plates 11 and 12)

- 7.2.65 Trench 031 contained a continuation of the large ditch seen in Trenches 007, 013, 020, 025, 040 and 052. Here, it appeared to truncate an undated earlier ditch [903116]. The large ditch [903112] (Plate 12) measured 5.08m in width and at least 1.2m in depth, the base having not been reached. Three fills were recorded within the excavated intervention (903113), (903114) and (903115). Pot of C1st Roman date was recovered from (903114). Similar to other Trenches where the large ditch was encountered, a recut [903119] was also identified here. It also contained a series of three fills (903120), (903121) and (903122). A single sherd of Roman pot was recorded within the lowest fill (903120).
- 7.2.66 Towards the north western end of Trench 031, ditch [903103] was aligned approximately north-west – south-east. It had steeply sloping sides and a concave base, measuring up

to 1.23m wide and 0.41m deep. Two secondary fills (903104) and (903105) were noted but no dating evidence was recovered.

- 7.2.67 Undated ditch [903123] had a V-shaped profile and a depth of up to 0.85m. It was subsequently recut by ditch [903126] on the same alignment but with a distinctly different profile, considerably more U-shaped, with steeply sloping side and wide concave base. The lower fill of [903126], fill (903125), contained pottery of AD 1-70 date and the upper fill (903127) appeared heavily disturbed by bioturbation.
- 7.2.68 Against the southern Trench baulk, ditch [903131] (Plate 11) was partially revealed in plan. It was 0.85m deep and at least 0.95m wide and contained four undated fills. It was truncated on its northern edge by curvilinear gully [903128] which was 0.63m wide and 0.38m deep. It contained a single secondary fill (903129) from which a bladelet core of possible Mesolithic or Early Neolithic date was recovered.

Trench 032 (figures 2, 26 and 69)

- 7.2.69 Trench 032 contained a number of possible features. Feature [903202] was an elongated oval in plan, approximately 2.5m long, 0.43m wide and 0.16m deep. It was interpreted as a possible segment of a truncated ditch. It contained a single undated fill (903203) and was cut by undated post hole [903204].
- 7.2.70 Two additional possible features were noted, an apparent pit [903206] and a possible ditch terminal [903208]. These features may be of geological origin.

Trench 033 (figures 2, 26 and 69)

- 7.2.71 A single ditch [903303] was recorded within the Trench, aligned approximately east-west. It had steeply sloping sides, a concave base and was up to 0.9m wide and 0.41m deep. It contained a single undated secondary fill (903304).

Trench 034 (figures 2 and 27)

- 7.2.72 Ditch [903403] was exposed along the western half of Trench 034 approximately 15m in length, being mostly straight in plan but curving towards the north at its eastern end. It was up to 0.5m wide and 0.19m deep, with very steep sides and a wide flat base. A single fill (903404) was identified, which did not contain any dateable artefacts.

Trench 035 (figures 2, 56, 70 and 100)

- 7.2.73 Terminal [903505] was 0.65m wide and 0.23m deep with steep, slightly irregular sides and a flat base. It contained a single undated fill (903506).
- 7.2.74 Ditch [903508] was aligned north-south with a generally U-shaped profile. It measured 0.69m in width and 0.19m in depth and contained a similar, single undated fill (903509).
- 7.2.75 Ditch [903510] was located approximately 7m to the east of [903508] and although not parallel, was also aligned in a broadly north-south direction. It had a wide and shallow profile up to 1.42m wide and 0.15m deep, which does not preclude the possibility it is an agricultural furrow of medieval or post-medieval date. However, Roman pottery of mid-late C1st was recovered from the only fill (903511).
- 7.2.76 Two tree throw holes [903506] and [903512] were also noted, along with two bioturbation features [903502] and [903503].

Trench 036 (figures 2, 27 and 70)

- 7.2.77 Trench 036 contained single ditch [903603] which was aligned approximately north-east – south-west. It contained two contemporary fills primary (903604) and (903605) that were sealed below secondary fill (903606). A broken flint blade of broad Prehistoric date was recovered from the latter.
- 7.2.78 A bioturbation related feature [903602] was also recorded.

Trench 037 (figures 2, 27 and 71)

- 7.2.79 Possible pit [903708] was circular in plan with near vertical sides and a concave base. It was 0.56m long, 0.53m wide and 0.36m with a single fill (903709). No finds were recovered.

Trench 038 (figures 2, 28 and 71)

- 7.2.80 Trench 038 contained a curvilinear ditch, which was situated towards the northern end of the Trench. It had two interventions excavated through it [903802] and [903804] which showed it to have steeply sloping sides and a flat base, with dimension of up to 0.78m wide and 0.38m deep. Late Iron Age/Early Roman pottery as well as post-medieval CBM was recovered from fill (903803), suggesting that the feature may be post-medieval in date but contained earlier residual material.
- 7.2.81 Appearing to be located within the return formed by [903802] and [903804], and only partially exposed against the western Trench baulk, was a possible post hole [903808]. It was up to 0.75m wide and 0.21m deep, the single fill (903809) containing moderate stone inclusions, perhaps the remnants of packing material. It did not contain any dateable artefacts.
- 7.2.82 A sub-circular pit [903806] was also recorded, with steep sides an irregular base 0.72m wide and 0.25m deep. It contained a single undated fill (903807).

Trench 039 (figures 2, 28 and 72)

- 7.2.83 Shallow ditch terminal [903902] was aligned broadly north-east – south-west and had a symmetrical, U-shaped profile up to 0.55m wide and 0.28m deep. It contained an undated secondary fill (903903).
- 7.2.84 Pit [903904] was sub-circular in plan up to 1.3m wide and 0.14m deep. It had a single undated fill (903905).

Trench 040 (figures 2, 57 and 72; plate 13)

- 7.2.85 Towards the north-eastern end of the Trench, a substantial sub-circular feature [904003] was partially revealed. It measured approximately 8.5m in length and up to 0.72m in depth and contained a single homogenous fill (904004). Post medieval CBM was recovered. It was interpreted as a possible water hole although it was not possible to be certain within the confines of the Trench, and no waterlogged or gleyed deposits were seen.
- 7.2.86 Ditch [904005] (Plate 13) was aligned approximately north – south and represents a continuation of the major ditch seen in Trenches 007, 013, 020, 025, 031 and 052. Within Trench 040 it was approximately 9m wide and at least 0.9m deep. The base was not

reached. Five fills were identified within the excavated intervention which, from earliest to most recent were (904011), (904010), (904009), (904007), (904008) and (904006). The uppermost, probably tertiary fill (904006) contained an assemblage of mid-late C1st pottery, struck flint and slag while (904007) appeared to represent possible in-situ burning and was visible in section as a dark lens 0.02m thick. Fill (904009) contained a small number of Late Iron Age/Early Roman pottery sherds, while other fills were devoid of finds.

Trench 041 (figures 2, 28 and 73)

- 7.2.87 Ditch [904102] was aligned east – west and had moderately sloping irregular sides and base. It was up to 0.41m wide and 0.14m deep, the single fill (904103) containing slag but no dateable artefacts.
- 7.2.88 Ditch [904104] was slightly larger but of generally similar proportions, with moderately sloping flat sides and a flat base. It contained a single fill (904105) which yielded an assemblage of Roman pottery, fired clay, worked flint and slag.

Trench 042 (figures 2, 29 and 73)

- 7.2.89 Trench 042 contained a possible waterhole [904204] which is likely to be associated with the similar feature encountered within Trench 040 immediately to the west. Where exposed, it measured 6.2m in width and 0.85m in depth. It contained two sterile, undated fills (904205) and (904206). Similar to [904003], no waterlogged or gleyed deposits were seen in [904204].
- 7.2.90 A bioturbation related feature [904203] was also recorded towards the south eastern end of the Trench.

Trench 043 (figures 2, 29 and 73; plate 14)

- 7.2.91 Within the north-eastern half of Trench 043 and approximately 14.2m in length was another possible waterhole feature [904302] (Plate 14). It was at least 1.05m deep and had irregular, stepped sides. The three identified fills (904303), (904304) and (904305) represented episodes of natural silting, with pottery of Middle Iron Age date recovered from the uppermost fill (904305).

Trench 044 (figures 2, 29 and 74)

- 7.2.92 Towards the southern end of the Trench was curvilinear possible ditch segment [904405] which was up to 0.54m wide and 0.41m deep. It had steeply sloping asymmetrical sides, tapering to a narrow concave base, and contained a single undated fill (904406).
- 7.2.93 A linear feature [904403] was interpreted as a probable modern hedgerow remnant, while irregular feature [904402] was thought to be formed through bioturbation.

Trench 045 (figures 2, 57 and 74)

- 7.2.94 Centrally located within the Trench was possible pit [904502], which was only partially exposed in plan. It had steeply sloping convex sides and a flat base, containing two undated secondary fills, (904503) and (904504).

Trench 047 (figures 2, 30, 74 and 100)

- 7.2.95 Ditch [904702] was aligned north-west – south-east with moderately sloping concave sides and base. It measured 0.85m in width, 0.25m in depth and contained a single undated fill (904703).
- 7.2.96 Within the south-western end of the Trench was deposit (904704) which was at least 4m in length, extending beyond the end of the Trench, and up to 0.13m thick. Although occasional charcoal fragments were noted within the deposit, it was thought to be naturally accumulated within a geological hollow.

Trench 048 (figures 2, 30 and 74)

- 7.2.97 A series of four ditches were identified within Trench 048, [904802], [904804], [904806] and [904808]. All were undated and contained single secondary fills.
- 7.2.98 Ditch [904802] had moderately sloping concave sides and base up to 0.67m wide and 0.16m deep.
- 7.2.99 Ditch [904804] was up to 0.24m deep and 0.64m wide, although it was truncated on the western side by ditch [904806] which had a similar concave sides and base. Ditch [904806] measured 1m in width and 0.22m in depth.
- 7.2.100 Ditch [904808] was slightly larger and was aligned parallel to [904804] in an approximate north-west – south-east orientation. It had moderately sloping, slightly irregular sides and a narrow concave base, measuring up to 0.68m wide and 0.32m deep.
- 7.2.101 An irregular tree bowl [904810] was also recorded.

Trench 050 (figures 2 and 30)

- 7.2.102 Undated feature [905002] was recorded centrally within the Trench and was interpreted as a probable large natural hollow within the geological substrate into which subsoil derived material (905003) had naturally accumulated. It had gently sloping sides with a flat base and was 6.75m wide with a depth varying between 0.09m and 0.23m.

Trench 051 (figures 2, 31 and 75)

- 7.2.103 Ditch [905103] was heavily disturbed through bioturbation and had asymmetrical sides and concave base. It measured up to 0.81m wide and 0.43m deep, with a single undated fill (905104).
- 7.2.104 Ditch [905105] was broadly parallel to [905103] in a general north – south alignment. It was 1.3m wide and 0.7m deep, with moderately sloping flat sides and a flat base. It contained a single homogenous fill (905106) from which no dateable artefacts were recovered.
- 7.2.105 A discrete area of bioturbation [905102] was also noted.

Trench 052 (figures 2, 57, 75 and 100)

- 7.2.106 At the western end of Trench 052, and not fully revealed in plan, was ditch [905204]. This was a continuation of the large ditch seen to the north in Trenches 007, 013, 020, 025, 031 and 040. Within Trench 052 it measured at least 4.4m in width and at least 0.52m deep. The western side of the cut was beyond the limits of the Trench and the base was not

reached. Three upper fills were identified (905205), (905206) and (905207) although none yielded any dateable artefacts.

Trench 053 (figures 2, 31 and 75)

- 7.2.107 Ditch terminal [905302] was heavily root disturbed. It had near vertical sides and a concave base, measuring 0.51m wide and 0.22m deep. It had a single undated fill (905303), possibly an intentional dump of flint-rich material.

Trench 054 (figures 2, 58 and 75)

- 7.2.108 An apparently isolated small pit or post hole [905403] was located towards the northern end of the Trench. It was circular in plan with steep concave sides and base, approximately 0.5m wide and 0.4m deep. Abundant unworked flint fragments were present with the single fill (905404), possibly packing material but there were no dateable artefacts.
- 7.2.109 A feature [905405] formed through bioturbation was recorded towards the south-eastern end of the Trench.

Trench 055 (figures 2, 31 and 76; plate 15)

- 7.2.110 Ditch [905502] (Plate 15) was partially exposed within the southern end of Trench 055. It was a substantial feature, measuring at least 4.3m wide and 0.88m deep, with neither the southern edge nor base of the ditch being reached. Four fills were identified within the intervention which, from earliest to latest, were (905504), (905503), (905505) and (905506). All represented episodes of natural silting and were entirely devoid of finds. It is thought possible that this ditch may continue into Trenches 059 and 066, with the part identified within Trench 055 on the very corner of the ditch as it turns towards Trench 066. This is largely due to the fact that it does not appear within Trench 062, approximately 10m to the east.

Trench 056 (figures 2, 32 and 76)

- 7.2.111 An irregular feature [905602] was identified, which was partially obscured beneath the eastern Trench baulk. It had steep sides and an irregular base that was up to 0.59wide and 0.16m deep. The feature contained a single sterile fill (905603) and may be of geological origin.

Trench 058 (figures 2, 32 and 76; plate 16)

- 7.2.112 Ditch [905802] (Plate 16) was aligned approximately north-east – south-west and had very steeply sloping irregular sides, tapering to a narrow concave base. It had an overall depth of 0.85m and a width of 1.15m. Two fills were recorded, primary fill (905803) and secondary fill (905804), which was partially disturbed by bioturbation. No finds were present.
- 7.2.113 A further ditch on broadly the same alignment, [905809] had irregular sides and base, with a recorded width of 0.9m and depth of 0.15m. It also contained a single undated fill (905810).
- 7.2.114 Tree bowl [905807] was truncated by ditch [905805]. The ditch was parallel to [905802] on the north-western side, up to 0.58m wide, 0.28m deep and had asymmetrical sides with a concave base. It contained a single undated fill (905806).

- 7.2.115 Towards the south-eastern end of the Trench, two pits were identified, neither of which were fully seen in plan. Pit [905811] was 0.69m wide and 0.3m deep where exposed, with moderately sloping sides and concave base. Pit [905813] was slightly larger at 1.44m wide and 0.41m deep and had moderately sloping sides with a flat base. Both were undated.

Trench 059 (figures 2, 32, 77 and 100; plate 17)

- 7.2.116 Substantial ditch [905902] (Plate 17) was thought to potentially be a continuation of the ditch seen in Trenches 055 and 066. Within Trench 059 it had a width of 5m and depth of at least 0.95m. It had steeply sloping, slightly irregular sides. A total of eight fills were recorded, formed through multiple phases of natural silting. Secondary fill (905907) contained a small assemblage of Late C1-3rd Roman pottery, while a single sherd and residual worked flint of Prehistoric date were recovered from the upper tertiary fill (905910).
- 7.2.117 The upper fills of ditch [905902] were truncated by a narrow undated gully [905911]. It contained a single secondary fill (905912).

Trench 060 (figures 2, 33 and 77; plate 18)

- 7.2.118 Ditch [906002] (Plate 18) had gently sloping concave sides and base and was up to 0.79m wide. The depth varied considerably within the excavated 1m intervention ranging between 0.2m at the east-facing section and 0.58m at the west-facing. It had a single fill (906003) which contained Middle Iron Age pottery.
- 7.2.119 Ditch [906004] was more substantial and was located at the southern end of the Trench. It was prominently curvilinear in plan, 0.4m, deep and at least 1.6m wide, with moderately sloping concave sides and a concave base. It contained a single homogenous fill (906005) which did not contain any dateable finds. It was truncated on the southern side by feature [906006], although since little was revealed in plan it was not possible to confidently identify the form or plan of this later feature. It appeared to be at least 1.3m wide and 0.4m deep with a single undated fill (906007). It also appeared to cut subsoil deposit (906008), visible at the southern end of the Trench, which overlaid [906004]. This would therefore suggest that, although undated, feature [906006] was of relatively recent date, perhaps broadly post-medieval.

Trench 061 (figures 2, 33 and 77)

- 7.2.120 Trench 061 contained an undated sub square pit [906106] towards the south-eastern end. It measured approximately 0.8m long, 0.7m wide and 0.35m deep with irregular sides and base. It contained a single fill (906107), possibly intentional backfill.
- 7.2.121 Three bioturbation related features [906102], [906104] and [906108] were also recorded.

Trench 062 (figures 2, 33, 77 and 78)

- 7.2.122 Undated post hole [906202] appeared isolated towards the north-eastern end of the Trench. It was sub-circular in plan, up to 0.26m wide and 0.12m deep. It contained a single fill (906203) in which the presence of charcoal was noted.
- 7.2.123 Ditch [906206] had a U-shaped profile and was 0.65m wide and 0.28m deep. It contained a single undated fill (906207) and was truncated by a later field drain [906204].

Trench 063 (figures 2, 34 and 78)

- 7.2.124 Possible pit [906302] was sub-circular in plan, up to 0.71m wide and 0.21m deep, with steeply sloping sides and a concave base. It contained a single fill (906303) with no dateable finds. It was not certain if this feature was of archaeological or geological origin. Adjacent feature [906305] and deposit (906304) were both thought to be naturally formed due to their irregular nature and shallow depth.

Trench 064 (figures 2, 34 and 78)

- 7.2.125 Curvilinear [906403] terminal was, where investigated, 0.29m wide and 0.18m deep. It had a U-shaped profile and contained a single undated fill (906404).

Trench 065 (figures 2, 34 and 78)

- 7.2.126 Possible pit [906504] was, where exposed, circular in plan with concave sides and base 0.59m wide and 0.51m deep. It contained a single undated fill (906505). During investigation it was not certain if it was a feature of archaeological or natural origin. An area of bioturbation [906502] was recorded nearby to the south-west.
- 7.2.127 Ditch [906506] was aligned approximately north – south, with moderately sloping concave sides and base. It was undated, with a primary fill (906507) and secondary fill (906508).

Trench 066 (figures 2, 58, 78 and 79)

- 7.2.128 Notable within Trench 066 was a substantial ditch [906604], which appeared to be a continuation of that seen in Trenches 055 and 059. Here, it measured 7.1m in width and was at least 1.2m deep, the base having not been reached. Four fills were identified within the excavated intervention (906605), (906606), (906607) and (906608). Secondary fill (906606) contained sherds of late Iron Age/Roman transition pottery while fill (906607) directly overlying (906606) was identified as possible deliberate backfill, with abundant angular unworked flints.
- 7.2.129 During excavation, feature [906602] was thought to be a probable tree bowl. It was only partially exposed in plan and had moderately sloping sides and a flat base. It was at least 0.6m wide and 0.25m deep with a single fill (906603). No finds were recovered.

Trench 067 (figures 2, 35 and 79; plate 19)

- 7.2.130 Three broadly parallel ditches were identified, two of which were undated. Ditch [906705] was 0.8m wide and 0.21m deep with moderately sloping concave sides and a concave base. Its fill (906706) contained a notable amount of irregular flint inclusions.
- 7.2.131 Ditch [906707] (Plate 19) had steeply sloping concave sides and base and was up to 0.45m wide and 0.74m deep. The lower recorded fill (906708) also contained flint inclusions and two sherds of Late Iron Age/Early Romano-British pottery, while the upper fill (906701) appeared to be derived from a slumping of the subsoil into the feature.
- 7.2.132 Ditch [906709] appeared slightly more irregular in plan, likely disturbed through bioturbation. It contained a single homogenous fill (906710) and was up to 1m wide and 0.38m deep.

- 7.2.133 Post hole [906703] appeared to have been heavily truncated, with a recorded depth of only 0.09m and a width of 0.63m, with slightly irregular sides and a flat base. It contained a single fill (906704) from which C1-2nd pottery as well as Prehistoric worked flint were recovered. Based on the presence of the pottery, it is likely that the flint is residual.

Trench 068 (figures 2, 35 and 79)

- 7.2.134 Ditch [906807] measured 0.37m in width and 0.16m in depth and was aligned approximately north-east – south-west. It had moderately sloping sides and a concave base with a single undated fill (906808).
- 7.2.135 Ditch [906811] was aligned approximately north-west – south-east, with steep convex sides that became near vertical, and a concave base. It was up to 0.6m wide and 0.55m deep and truncated an area of bioturbation. It contained two undated secondary fills (906812) and (906813).
- 7.2.136 Three bioturbation related features [906803], [906805] and [906809] were also present within the Trench.

Trench 069 (figures 2, 35 and 80)

- 7.2.137 Ditch [906904] measured 1.3m wide and 0.31m deep, with moderately sloping sides and a flat base. It was aligned north-east – south-west. A sequence of three fills were recorded which were, from earliest to latest (906905), (906906) and (906907). None yielded any dateable artefacts.
- 7.2.138 Sub-circular feature [906902] was thought to be formed through bioturbation.

Trench 070 (figures 2, 36 and 80)

- 7.2.139 Ditch [907004] was heavily disturbed through bioturbation but was slightly curvilinear in plan. It was aligned north – south and measured 0.9m wide and 0.6m deep, with steeply sloping, slightly irregular sides and a concave base. Two fills were present (907005) and (907006), neither of which contained any finds.
- 7.2.140 Close to the eastern end of the Trench and just to the east of [907004] was ditch [907007]. This ditch was of a notably different profile with gently sloping sides and a flat base, the feature being up to 1.5m wide and 0.35m deep. It contained a single sterile fill (907008).
- 7.2.141 Features [907002] and [907003] were both interpreted as having been formed through bioturbation.

Trench 073 (figures 2, 36, 80 and 81; plate 20)

- 7.2.142 Possible pit [907302] was slightly irregular in plan and was only partially revealed within the Trench. It had concave sides and base and was up to 0.81m wide and 0.56m deep. Three undated fills (907303), (907304) and (907305), formed through natural silting, episodes were recorded. No finds were recovered.
- 7.2.143 Possible pit [907302] was slightly truncated along its north-western edge by ditch [907306]/[907308] which was up to 0.27m wide and 0.11m deep. A single fill (907307)/907309 was identified in both the excavated interventions which did not contain any finds.

- 7.2.144 A substantial pit [907310] (Plate 20) was identified towards the south-eastern end of the Trench, measuring 0.68m deep and at least 5.73m wide. The basal primary fill (907311) contained a sherd of post-medieval pottery, suggesting that the feature is much later than many of the features seen elsewhere on Site. This fill was sealed below a series of secondary deposits (907312), (907313), (907314) and (907315) apparently derived from various silting and dumping episodes. Finds recovered from the upper-most fill (907313) seemed to confirm a relatively recent post-medieval date, although did also contain some residual 1st century Roman material.

Trench 077 (figures 2, 36, 81 and 100)

- 7.2.145 Three features formed through bioturbation [907702], [907704] and [907706] were recorded.

Trench 079 (figures 2, 37 and 82)

- 7.2.146 Terminal [907902] was aligned north-west – south-east and had gently sloping sides with a largely flat base. A total of 0.65m in length was exposed from beneath the north-western Trench baulk and it was 0.24m deep. It contained a single undated fill (907903).

Trench 081 (figures 2, 37 and 82)

- 7.2.147 A curvilinear gully [908102] was identified at the western end of the Trench which was up to 0.48m wide and 0.13m deep. It had moderately sloping asymmetrical sides and a concave base with a single fill (908103). It did not contain any finds.

- 7.2.148 Irregular feature [908104] was determined to have been formed through bioturbation.

Trench 082 (figures 2, 37 and 83)

- 7.2.149 At the eastern end of the Trench was possible ditch [908202] which was at least 1.8m wide and 0.58m deep. It did not appear to extend into Trench 079 immediately to the north, which might suggest it is in fact a large pit or similar feature, rather than a ditch. Two fills were noted within the part of the feature that could be investigated, (908203) and (908208), neither of which yielded any dateable artefacts.

- 7.2.150 A series of four possible furrows [908204], [908205], [908206] and [908207] were aligned north – south and measured up to 2m wide and 0.05m deep. However, no other furrows appeared to be present in nearby Trenches, leading to the conclusion that they may just represent localised wheel rutting or similar activity.

Trench 083 (figures 2, 38 and 83)

- 7.2.151 Three small ditches [908302], [908304], [908306] were recorded within the central portion of Trench 083, all on a broadly similar north-east – south-west alignment. Ditches [908302] and [908304] had gently sloping concave sides and base, while [908306] had steeper sides and a flatter base. All were shallow, with [908304] noted as having the greatest depth at 0.14m. All three contained single secondary fills that were devoid of artefacts.

Trench 084 (figures 2, 38, 83 and 100)

- 7.2.152 Terminal [908402] had steeply sloping side and a concave base, with approximately 1.05m visible in plan from beneath the north-eastern Trench baulk. It had a well-defined

terminal end and measured 0.75m wide and 0.4m deep. A single undated fill (908403) was recorded.

Trench 088 (figures 2, 38 and 83)

- 7.2.153 Possible ditch [908802] was recorded on a north-west – south-east alignment. It had irregular but steeply sloping sides and a concave base, and contained a single undated fill (908803)

Trench 090 (figures 2, 39, 83 and 101)

- 7.2.154 Aligned east – west, ditch [909004] measured 0.8m, wide and 0.2m deep. It had moderately sloping concave sides with a flat base. It contained fill (909005) which did not yield any finds.
- 7.2.155 Bioturbation [909003] was also recorded.

Trench 091 (figures 2 and 39)

- 7.2.156 Two features formed through bioturbation were recorded, [909102] and [909103].

Trench 093 (figures 2, 39, 84 and 101)

- 7.2.157 Possible post hole [909302] was circular in plan, 0.29m wide and 0.12m. There was no evidence of a post pipe and it contained a single undated fill (909303). An assemblage of animal bone recovered from (909303) were thought to be the remains of a lamb or kid.
- 7.2.158 Possible curvilinear gully [909306]/[909308] was up to 0.14m wide and 0.1m deep, with gently sloping sides and an irregular base. Both interventions contained single fills (909307) and (909308), neither of which produced any dating evidence. It was uncertain if the feature was formed through bioturbation or archaeological means.
- 7.2.159 A fragment of a Roman silver snake bracelet was recovered from topsoil (909300), potentially related to cult practices associated with Asclepius and Mercury (see specialist report, section 8.2).
- 7.2.160 An additional bioturbation related feature [909304] was also present within the Trench.

Trench 094 (figures 2, 40 and 101)

- 7.2.161 An area of bioturbation [909402] was noted within the Trench.

Trench 097 (figures 2, 40, 84 and 101)

- 7.2.162 An east-west orientated terminal [909703] was recorded towards the south-eastern end of the Trench. It was 0.73m wide and 0.27m deep with irregular sides and base. It contained a single undated fill (909704).
- 7.2.163 Feature [909702] was thought to have formed through bioturbation.

Trench 098 (figures 2, 40 and 84)

- 7.2.164 Large pit [909805] was irregular in plan with steeply sloping sides and up to 4.1m wide. The excavated depth was 1.15m but the base was not reached. A series of five rills were recorded (909806), (909810), (909811), (909812) and (909813). The feature was interpreted as a probable extraction pit and the earliest exposed fill (909806) contained post medieval CBM.

7.2.165 Pit [909807] was sub-circular in plan and up to 1.5m wide and 0.75m deep, with moderately sloping convex sides and a concave base. Two undated fills were present (909808) and (909809).

7.2.166 Sub-circular feature [909803] was recorded as a small area of bioturbation.

Trench 099 (figures 2, 41, 84 and 85)

7.2.167 Several features were identified within the limits of Trench 099. Terminal [909902] was up to 0.82m wide and 0.36m deep with moderately sloping concave sides which steepened towards the flat base. It contained single fill (909903) which was undated.

7.2.168 Ditch [909904] was aligned east – west and had concave sides and base. It was at least 0.46m wide and 0.26m deep and was partially truncated on the northern side by ditch [909906] which was of similar proportions and on the same alignment. Both ditches contained single secondary fills, but no dating evidence.

7.2.169 Features [909908] and [909910] were both thought to have formed as a result of bioturbation, possibly an old hedgerow.

Trench 102 (figures 2, 41 and 85)

7.2.170 A single irregular bioturbation related feature [910203] was identified.

Trench 103 (figures 2, 41 and 85)

7.2.171 Terminal [910305] extended approximately 1m into the Trench and was 0.73m wide and 0.44m deep, with steeply sloping concave sides and an irregular. It contained a single fill (910306), but no finds were recovered.

7.2.172 Linear feature [910305] had an irregular profile and was interpreted as bioturbation.

Trench 104 (figures 2 and 42)

7.2.173 A single feature formed through bioturbation [910403] was recorded.

Trench 105 (figures 2, 42 and 85)

7.2.174 With an east – west orientation, undated ditch [910503] had moderately sloping convex sides and a flat base, up to 0.58m wide and 0.27m deep. A single fill (910504) was present.

7.2.175 A truncated pit [910505] was located roughly centrally within the Trench. It was oval in plan and measured 0.62m x 0.37m, with a depth of 0.14m. It contained a charcoal-rich fill (910506), suggesting a deliberate dump of hearth or industrial related waste.

Trench 106 (figures 2, 42 and 85)

7.2.176 Probable post hole [910602] appeared isolated in the Trench but partially beneath the eastern baulk. It was undated and contained a single fill (910603).

Trench 107 (figures 2, 43 and 85)

7.2.177 Undated post hole [910703] was circular in plan, up to 0.42m wide and 0.27m deep. It had steeply sloping sides and a stepped base, possibly reflective of where a post had been intentionally worked free. Fill (910704) did not contain any dating evidence and no other post holes or additional features were noted nearby.

Trench 108 (figures 2, 43 and 85)

- 7.2.178 Ditch [910802] was up to 0.38m wide and 0.18m deep, on an east – west orientation. It had moderately sloping sides and a concave base. A single undated fill (910803) was present.
- 7.2.179 Irregular terminal [910804] was recorded as having likely been formed through bioturbation rather than having archaeological origin.

Trench 109 (figures 2, 43 and 86)

- 7.2.180 Two possible terminals were identified within Trench 109. Terminal [910902] was steep sided, with a narrow concave base that measured 0.26m wide and 0.11m deep while terminal [910904] had gently sloping concave sides and base. It measured 0.38m in width and 0.11m in depth. Both features had single undated fills. Due to the proximity of bioturbation related features recorded nearby [910906] and [910908], the possibility of [910902] and [910904] being formed through root action was not ruled out.

Trench 110 (figures 2, 44 and 86)

- 7.2.181 Two parallel ditches were present towards the north-western end of the Trench, orientated north-east – south-west. Ditch [911002] was 0.48m wide and 0.24m deep with steeply sloping sides and a concave base. Ditch [911008] truncated tree bowl [911006] and was 1.4m wide and 0.49m deep. It had steeply sloping, concave sides and base. Both ditches contained single, undated fills. A feature thought to relate to bioturbation [911004] was located between the two ditches.
- 7.2.182 Linear feature [911010] had steep sides and largely flat base and was up to 0.55m wide. It was thought to be of relatively recent date as in section it was seen to cut subsoil (911001).

Trench 111 (figures 2, 44 and 86)

- 7.2.183 Possible pit or terminal [911108] was only partially exposed in plan against the southern Trench baulk and was partially truncated by a land drain. It had asymmetrical sides and an irregular base, with a maximum depth of 0.46m and width of 1.03m. It contained a single fill (911109) from which no dateable finds were recovered.
- 7.2.184 Two bioturbation related features [911102] and [911104] were also noted towards the eastern end of the Trench.

Trench 112 (figures 2 and 44)

- 7.2.185 A bioturbation related feature [911202] was recorded.

Trench 113 (figures 2, 45 and 87)

- 7.2.186 Possible terminal [911303] was at least 1.7m long, 0.7m wide and 0.21m deep. It had gently sloping concave sides and base. A single fill (911304) was present, but no dating evidence.

Trench 114 (figures 2 and 45)

- 7.2.187 A naturally derived feature [911402] was recorded towards the south-eastern end of the Trench.

Trench 115 (figures 2, 45 and 87)

- 7.2.188 A possible post-medieval ditch [911504] was present centrally within the Trench. It appeared heavily truncated, surviving to a depth of 0.12m, and was up to 0.51m wide. It had gently sloping concave sides and base. A single fill (911504) was recorded.
- 7.2.189 Sub-oval feature [911503] towards the western end of the Trench, was thought to be the result of bioturbation.

Trench 116 (figures 2, 46 and 87)

- 7.2.190 Possible terminal [911604] was up to 0.82m wide and 0.38m deep, with convex sides and an irregular base. During excavation it was not certain if it was formed through archaeological means or bioturbation, particularly as possible animal burrow [911602] was recorded to the east. A single sterile fill was present (911605).

Trench 117 (figures 2, 46 and 87)

- 7.2.191 A single natural feature [911702] was identified.

Trench 118 (figures 2, 46, 87 and 88; plate 21)

- 7.2.192 At the north eastern end of the Trench, undated terminal [911802] was aligned approximately north - south. It was 0.8m wide and 0.35m deep with concave sides and base. It contained a single secondary fill (911811).
- 7.2.193 Pit [911803] (Plate 21) was oval in plan, measuring up to 1.3m wide and 0.62m deep. It had steeply sloping, irregular and asymmetrical sides and base. It contained a single undated fill (911804) which was later truncated by a small ditch [911805].
- 7.2.194 Ditch [911805] was also undated and was up to 0.85m wide and 0.26m deep. It contained a single undated fill (911806).
- 7.2.195 Undated ditch [911807] was aligned north – south, measured 0.8m in width and 0.14m in depth and contained a single fill (911808). The ditch truncated gully [911809].
- 7.2.196 Gully [911809] had notably steep sides and a flat base, perhaps suggestive of a beam slot. It was 0.38m wide and 0.18m deep, with a single undated fill recorded (911810).

Trench 120 (figures 2 and 47)

- 7.2.197 A sub-oval feature [912002] recorded within the southern half of the Trench was interpreted as an area of bioturbation.

Trench 122 (figures 2, 47 and 88; plate 22)

- 7.2.198 Aligned approximately north-west – south-east within the centre of the Trench was ditch [912207] (Plate 22). It had very steeply sloping convex sides and a slightly irregular base. A sequence of six fills was present (912208), (912209), (912210), (912211), (912213) and (912214). The basal fill (912208) produced a fragment of medieval or post-medieval ceramic tile.
- 7.2.199 Irregular features [912203] and [912205] were both thought to be the result of bioturbation.

Trench 123 (figures 2, 47 and 89)

- 7.2.200 The three features [912302], [912303] and [912304] noted within Trench 123 were all thought to be formed through bioturbation.

Trench 124 (figures 2, 48 and 89)

- 7.2.201 Towards the western end of Trench 124, ditch [912402] was 1m wide and 0.3m deep. It did not contain any dating evidence. Primary fill (912403) was overlain by secondary fill (912404).

Trench 125 (figures 2 and 48)

- 7.2.202 Two irregular areas of bioturbation [912502] and [912503] were recorded.

Trench 126 (figures 2, 48, 89 and 90)

- 7.2.203 Ditch [912606] was up to 0.59m wide and 0.12m deep, with gently sloping concave sides and a concave base. It contained a single secondary fill (912607) and was undated.

- 7.2.204 Four bioturbation features [912602], [912604], [912608] and [912610] were also recorded, located throughout the Trench.

Trench 127 (figures 2, 49 and 90)

- 7.2.205 Two possible intercutting pits [912704] and [912706] were recorded against the south-western Trench baulk, although it was not entirely certain if they were of archaeological origin due to their irregular shape in plan. Both contained single fills and no dating evidence, the diffuse nature of their fills making the relationship between the two features unclear.

- 7.2.206 Undated pit [912708] was sub-circular in plan, measuring 1.43m x 0.93m, and was 0.26m deep. It had moderately sloping sides and a flat base, with a single fill (912709).

- 7.2.207 Immediately adjacent to [912708] was pit [912710]. This was slightly smaller, measuring 0.91m x 0.56m and 0.27m deep, but was similarly undated and contained a single fill (912711).

- 7.2.208 Terminal [912712] was aligned north – south, with a length of 0.77m exposed within the Trench, a width of 0.48m and depth of 0.22m. It had steeply sloping sides and a flat base. A single fill was recorded (912713) which contained frequent inclusions of unworked flint nodules, which appeared to have been deliberately dumped. A fragment of slag was also recovered, although no firm dating evidence was forthcoming.

- 7.2.209 Two bioturbation related features [912702] and [912703] were recorded towards the south-eastern end of the Trench.

Trench 129 (figures 2 and 49)

- 7.2.210 Irregular feature [912902] was interpreted as having been formed through bioturbation.

Trench 130 (figures 2, 49 and 90)

- 7.2.211 Three bioturbation related features [913003], [913005] and [913007] were recorded.

Trench 131 (figures 2, 50 and 91)

- 7.2.212 Two irregular linear features [913103] and [913104] were interpreted as variations in the natural geology.

Trench 132 (figures 2, 50 and 91)

- 7.2.213 Two features formed through bioturbation [913202]/[913204] and [913206] were recorded within the Trench.

Trench 134 (figures 2, 50 and 91)

- 7.2.214 Pit [913403] was sub-circular, measuring 1.52m x 1.46m in plan and 0.43m deep. It had moderately sloping sides and a concave base. Abundant inclusions of unworked flint were noted within the single fill (913404) but no dating evidence was recovered.

- 7.2.215 Possible pit [913406] was only partially exposed in plan and where exposed was 1.06m wide and 0.47m deep. It had irregular sides and base and contained a single, homogenous fill (913407). It did not contain any artefacts.

- 7.2.216 In plan pit [913406] appeared to cut curvilinear terminal [913408]. The terminal had well-defined steep sides and a flat base and was 0.34m wide and 0.21m deep. The fill (913409) was noted as containing large numbers of flint nodules, suggesting possibly intentional back fill. No finds were recovered.

- 7.2.217 Pit [913410] was not seen fully in plan but as excavated was 1.3m wide and 0.42m deep. It had steeply sloping concave sides and a slightly irregular base. It contained one fill (913411) but no finds.

- 7.2.218 A possible ditch [913412] was also identified within the Trench, although it was also surmised that it may be of geological origin. It had concave sides and base, measuring up to 1.02m wide and 0.26m deep. A single undated fill was present (913413).

- 7.2.219 A small, sub-circular feature [913405] was thought to have been caused by root action.

Trench 135 (figures 2, 51, 92 and 101; plates 23-25)

- 7.2.220 Terminal [913502] measured at least 1m long, 0.97m wide and 0.32m deep. It had moderately sloping sides and an irregular base. It contained a single undated fill (913503).

- 7.2.221 Feature [913504] was sub-oval in plan and of uncertain origin. It had steep sides, a flat base and was up to 0.95m wide and 0.2m deep. A single fill (913505) was identified, but no artefacts were recovered. A similar feature was recorded as [913506], although with smaller dimensions. It similarly contained a single undated fill (913507).

- 7.2.222 Ditch terminal [913508] was aligned east-west. Moderately sloping irregular sides and a concave base were recorded, as was a single secondary fill (913509). No dating evidence was recovered.

- 7.2.223 Towards the southern end of the Trench, a large feature [913510] (Plate 23) was found. It was up to 5.5m wide with the base encountered at a depth of 0.82m. It had moderately sloping sides which became near vertical on the southern side, and a flat base. It contained four identifiable fills (913511), (913512), (913513) and (913514). The feature was fully exposed in the Trench Extension (see below).

- 7.2.224 The Trench Extension (plates 24 and 25) subsequently excavated in 2021 demonstrated that the stratigraphic sequence was more complicated for feature [913510] and the adjacent, more extensive sub-rectangular feature [913577] (see below, Grouped as {913570}). It also uncovered a small, focused area of activity to the west, and several more disparate features, which consisted of six pits, 13 postholes and the shallow remains of two linear trending features.
- 7.2.225 The earliest feature in the Group {913570} was a probable well 913597, in the central part of the trench. It was seen to extend over 1m deep and contained a single identified fill (913598).
- 7.2.226 Potentially associated with this was the more extensive sub-rectangular feature [913577] which measured 18m by 10m in area and 1.9m deep in the centre, with the sides being gently sloped out to the edges. It was not possible to determine if [913577] truncated the well fill (913598) and well [913597] or whether the two features were constructed at the same time. Certainly the earliest fill of [913577], (913596) overlay the well fill (913598) and demonstrated that a change in events took place.
- 7.2.227 The lower fills of [913577] consisted of (913596) in the central part and (913594) at the outer edge. Above (913594) was a sequence of three fills (913578), (913580) and (913579).
- 7.2.228 A possible re-cut or a pit cut into the larger feature was [913582], which measured 1.3m wide and was 0.33m deep and had a single fill (913583). This was in turn truncated by a similar re-cut or pit [913584] which was 2.15m wide and 0.26m deep. It contained fills (913585) and (913595) which produced 12 sherds of Middle Iron Age pottery.
- 7.2.229 Overlying this was a more extensive general fill seen as (913576) and (913586) which produced 10 sherds of pottery dated to the late C1st BC to AD70 (Late Iron Age Early Roman). This indicated a possible change in the depositional environment and suggested when the feature was being infilled.
- 7.2.230 Truncating fill (913576=913586) was a re-cut or pit [913587], over 1m in width and 0.24m deep, which contained two fills (913588) and (913589). To one side, truncating the lower fill (913588) was a similar, but slightly smaller re-cut or pit [913590] which had a single fill (913591).
- 7.2.231 Sealing these re-cuts or pits was an extensive layer (913592), 0.34m thick, which was consistent with a gradual infilling. Above this was a similar 0.56m thick deposit seen as (913571) and (913593) which was infilling the area and may have been transitional subsoil formation and the fine texture and depth was indicative of a longer period of formation. This deposit produced a small number of pottery sherds which had fragments of Middle Bronze Age but also late C1st BC to AD70 (Late Iron Age Early Roman).
- 7.2.232 Although it was difficult to be certain it appeared that part of the upper deposit (913571=913593) overlay the eastern edge of pit [913510] but given that it was an ongoing depositional environment it could not be fully confirmed. The larger feature [913577] was not apparent in the initial evaluation trench, when [913510] was identified.
- 7.2.233 Pit [913510], (plate 23) was seen to truncate the lower part of deposit (913571=913593) at the edge of the feature; although this was less clear as the evaluation trench had been positioned over the juxtaposition of the two features; [913510] and [913577]. The basal fill

HS2 Ltd Code Accepted

(913512) consisted of a 0.08m thick layer of mixed flint nodules which had been deliberately placed on the base of the feature onto the natural clay, presumably to provide a firm foundation on which to place something or perform some sort of activity. Fill (913511) immediately above appeared to be an intentional deposit of stone and burnt material and was interpreted as industrial waste. A piece of slag was also recovered. The other fills appeared to be derived from more natural silting processes, although it was noted that (913513) contained a large, but apparently unworked, sandstone block. Pottery of Middle Iron Age date was recovered from upper fills (913511) and (913514). Deposit (913514) may have been equivalent to (913511), although it could not be confirmed.

- 7.2.234 To the west of the features [913510] and [913577] was a rectangular pit [913558], which measured 2.4m by 1.5m and was 0.39m deep. It had moderately sloping sides and a flat base and contained a sequence of four fills. There was a 0.04m, thin initial deposit at the base (913559), overlain by a 0.12m thick dark hued deposit (913560) with flint nodules and charcoal flecks. Above this was a 0.04m thin deposit of lighter clay, indicative of a hiatus, with the final 0.24m thick fill (913533) being again darker hued and contained flint nodules and charcoal flecks. This upper fill also produced the only pottery from the feature, which was a small number of sherds dated to the Middle Bronze Age.
- 7.2.235 Focused on this pit, and potentially forming a structure were eight post holes, [913519], [913523], [913525], [913527], [913536], [913538], [913543] and [913545], although two were re-cut / repositioned, arranged in a slightly rectilinear pattern to the south-east. The post holes ranged in size from 0.2m to 0.43m in diameter and from 0.09m to 0.22m in depth. Seven of the post holes contained only single fills, which were generally mid to dark grey and contained charcoal flecks. Post holes [913527], [913529] and [913538] had the remains of postpipes, formed by the post-depositional rotting of the post. In two instances post holes truncated earlier post holes, possibly indicating replacement or repair. Post hole [913519] was truncated by [913521], and post hole [913527] was truncated by [913529].
- 7.2.236 In the south-east part of the area was a sub-square to rounded pit [913553], which measured 1.17m by 1.13m and with moderately steep sides and a flat base was 0.26m deep. The single fill (913554) was dark hued, with heat affected flint and charcoal inclusions and similar to those seen in pit [913558].
- 7.2.237 Two post holes [913515] and [913517] were of similar size, form and fills and were north of the distinct group focused on pit [913558] to the south. They were circular, measured 0.17-0.23m in diameter and both were 0.06m deep with gently sloped sides and concave base. No dating evidence was recovered from either fill (913515) or (913518), respectively.
- 7.2.238 A slightly irregular oval pit [913534] with gentle concave sides and base was seen on the south side of the area. It measured 1.9m wide and 0.36m deep and contained two fills. Fill (913555) was firmer and there was a diffuse boundary with the overlying fill (913535), which contained a moderate assemblage of pottery dated to the Middle Iron Age.
- 7.2.239 Just north was a sub-rectangular pit [913551] which measured 0.93m by 0.51m, was 0.23m deep and contained a single fill (913552) that yielded no artefactual material. The

pit was truncated by a later pit [913556] which measured 1.4m by 0.85m, was 0.33m deep and the single fill (913557) also contained no artefactual material.

- 7.2.240 A linear trending feature, aligned north-west – south-east was investigated in two interventions [913547] and [913549]. The feature was 4.73m in length, 0.48m wide and up to 0.3m in depth, with concaves sides and base and contained a single fill, seen as (913548) and (913550) in the two interventions, which produced no artefactual material.
- 7.2.241 In the northern part of the area were several shallow features which made them more difficult to interpret.
- 7.2.242 Feature [913566] was a short linear trending feature, with concave sides and base and a single fill (913567), with a fine texture consistent with gradual infilling. This was adjacent and partially truncated by a 0.31m diameter circular post hole [913564] which contained a single fill (913565). Investigation demonstrated that the feature had no relationship to the large discrete feature [913577], seen here as [913568].
- 7.2.243 A possible pit [913562] was clear in plan but very shallow at only 0.04m thick. It contained a dark hued fill (913563) which contained charcoal flecks but no finds.
- 7.2.244 Another short linear trending feature was seen as [913572] and may have been a discontinuous part of [913566] and may have continued as [913541] and could have incorporated [913504], seen in the evaluation stage.
- 7.2.245 Feature [913572] was slightly asymmetrical in profile, with concave sides and base and a single fill (913573) that contained no finds. The feature was cut by the shallow remains of a possible post hole [913574], which was 0.36m in diameter, 0.06m deep and the single fill (913575) contained no finds.
- 7.2.246 A small feature [913541] was investigated and was interpreted as a possible terminus or pit and potentially a continuation of [913504]. The single fill (913542) contained no artefacts, or inclusions of note.

Trench 136 (figures 2, 51 and 93)

- 7.2.247 Two intercutting ditches were recorded within Trench 136. The earlier [913604] was up to 1.1m wide and 0.38m with steeply sloping sides and flat base. It was undated, with a single secondary fill (913605). It was truncated on the north-eastern side by narrow ditch [913602] which was 0.4m wide and 0.19m deep. It also contained a single, undated fill (913603).

Trench 138 (figures 2 and 51)

- 7.2.248 A single bioturbation related feature [913802] was recorded.

Trench 139 (figures 2, 52 and 93)

- 7.2.249 Three features [913902], [913903] and [913904] interpreted as of probable natural origin were identified within the Trench.

Trench 140 (figures 2, 52 and 93)

- 7.2.250 Two features formed through bioturbation [914002] and [914004] were recorded.

Trench 141 (figures 2, 52 and 93)

- 7.2.251 Ditch [914104] was aligned approximately north – south and appeared in plan to potentially be terminating just beyond the north-eastern Trench baulk. It was 1.4m wide and 0.5m deep with concave sides and base. It contained a single undated fill (914105) and was truncated by a land drain as well as a probable root hollow [914106].
- 7.2.252 A single bioturbation related feature [914103] was present within the Trench.

Trench 142 (figures 2, 53 and 93)

- 7.2.253 Possible undated pit [914202] was sub-oval in plan, up to 0.87m wide and 0.12m deep. It contained a single fill formed through natural silting (914203).
- 7.2.254 Pit [914204] was significantly larger, only partly exposed in the evaluation trench but seen in full in the Trench Extension (plate 26). It was determined to be 3.45m wide and 1.03m deep. Three fills were recorded (914206), (914207) and (914208). The two upper fills (914207) and (914206) both contained small amounts of pottery of Middle Iron Age date.
- 7.2.255 A single feature formed through bioturbation [914211] was recorded in the Trench extension.

Trench 145 (figures 2, 53 and 94)

- 7.2.256 Possible pit [914504] appeared to be heavily root disturbed. Where exposed in plan it was 1.27m wide and 0.47m deep with moderately sloping sides and a concave base. It contained a single fill (914505) but no artefacts.
- 7.2.257 Two bioturbation features [914502] and [914506] were also recorded.

Trench 146 (figures 2, 53 and 94)

- 7.2.258 A possible curvilinear terminal [914604]/[914606] extended from beneath the southern Trench baulk and was up to 0.29m wide and 0.2m deep. A single secondary fill was recorded (914605)/(914607) which did not contain any finds.
- 7.2.259 Four bioturbation related features [914602], [914603], [914608] and [914609] were identified throughout the Trench.

Trench 147 (figures 2, 54 and 94)

- 7.2.260 A possible terminal [914702] was recorded towards the northern end of the Trench. It was well-defined, with moderately sloping sides and a largely flat base, and was up to 0.43m wide and 0.09m deep. A single fill (914703) was identified which did not contain any finds.
- 7.2.261 Irregular feature [914704] was interpreted as resulting from bioturbation.

Trench 148 (figures 2, 54 and 95)

- 7.2.262 A potential terminal [914804] measured 0.85m wide and 0.19m deep, with moderately sloping sides and an irregular base that had been disturbed through bioturbation. An undated fill (914805) was recorded.

- 7.2.263 A further possible terminal [914806] was 0.54m wide and 0.23m deep with moderately sloping concave sides and base. It similarly contained a single, undated fill (914807).
- 7.2.264 Ditch [914808] was orientated east – west and was 0.56m in width and 0.32m in depth. It had concave sides and base and contained a single undated fill (914809). It was truncated by undated post hole [914810].
- 7.2.265 Against the northern Trench baulk was probable pit [914812]. Where visible it was semi-circular in plan and up to 0.98m wide and 0.84m deep. It had steep, slightly irregular sides and a concave base. The basal fill (914813) was formed through a primary silting episode and was sealed below secondary fills (914814) and (914815) which both contained pottery dated AD 1-70. The uppermost fill (914816) was thought to derive from the slumping of a subsoil-type deposit and contained a lead object as well as C1st pottery.
- 7.2.266 Irregular linear feature [914802] was, upon investigation, determined to be of geological origin.

Trench 149 (figures 2, 54, 95 and 96)

- 7.2.267 Two intercutting but undated ditch terminals [914912] and [914914] were seen within Trench 149. There was evidence that both had been disturbed through bioturbation [914908]. The earlier ditch [914912] was curvilinear in plan with moderately sloping sides and a flat base. It measured at least 0.64m in width and 0.2m in depth, containing a single secondary fill (914913). This was truncated by the later ditch [914914] which closely followed [914912] in plan but was slightly longer. It was 0.6m wide and 0.26m deep with a U-shaped profile. It similarly contained a single secondary fill (914915).
- 7.2.268 Ditch [914917] was aligned north-west – south-east and was 0.87m wide and 0.25m deep. It had moderately sloping concave sides and wide concave base, with a single fill (914919) from which post-medieval CBM was recovered. The ditch was truncated by later ditch [914916] which also appeared to be cutting subsoil (914901) and had steeply sloping side and narrow concave base, 0.27m wide and 0.09m deep. It had a single undated fill (914922) but stratigraphically appeared to be relatively recent in date.
- 7.2.269 A total of six features spread throughout the Trench [914902], [914904], [914906], [914908], [914910] and [914918] were all interpreted as having been formed through bioturbation.

Trench 150 (figures 2, 55 and 96)

- 7.2.270 Pit [915002] was of uncertain function. It was sub circular in plan up to 0.789m long, 0.44m wide and 0.17m deep. It had gently sloping concave sides and base with a single undated fill (915003).
- 7.2.271 Curvilinear ditch [915006] was undated. It measured 0.64m wide and 0.34m deep and had steeply sloping sides with a concave base. A single secondary fill (915007) was recorded.
- 7.2.272 Possible post hole [915008] was 0.7m at its widest and 0.26m deep with stepped sides becoming near vertical towards the concave base. It had a single undated fill (915009).

HS2 Ltd - Code 1 Accepted

- 7.2.273 Feature [915004], only partially exposed from beneath the northern Trench baulk, was determined to be bioturbation.

Trench 151 (figures 2, 55, 96, 97 and 101)

- 7.2.274 Possible pit [915105] was not fully exposed in plan but appeared to be sub-oval with near vertical sides and a concave base. It measured 0.9m wide and 0.38m deep and contained a single sterile fill (915106). No artefacts were recovered.
- 7.2.275 Ditch [915107] was up to 0.61m wide and 0.4m deep, aligned north-west – south-east. It had steeply sloping flat sides and a flat base. Two fragments of struck flint were recovered from the single secondary fill (915108). Without further dateable artefacts, it is not possible to determine if the flint indicates the date of the ditch or is residual in a later feature.
- 7.2.276 Possible pit [915109] was undated and disturbed through bioturbation. It had near vertical sides and a concave base with a single secondary fill (915110).
- 7.2.277 An irregular tree throw hole [915102] was also noted.

Trench 152 (figures 2, 55 and 97)

- 7.2.278 Pit [915203] was not fully exposed in plan but appeared sub-circular and up to 0.9m wide and 0.4m deep. It had moderately sloping asymmetrical sides and a concave base with two fills identified (915204) and (915205). Both were devoid of artefacts and formed through natural silting.
- 7.2.279 Pit [915206] was 0.6m wide and 0.25m deep, appearing sub-circular in plan. It had moderately sloping, concave sides and a largely flat base. It contained a single secondary fill (915207) that contained no finds.
- 7.2.280 Curvilinear ditch [915208] was 1.32m wide and 0.68m deep with steeply sloping sides and a flat base. Three fills were present (915209), (915210) and (915211), none of which contained any dateable finds, and which were formed through natural silting episodes.
- 7.2.281 Pit [915214] was not fully exposed in plan but appeared sub-oval and had steeply sloping concave sides and a largely flat base. It contained three undated dills (915215), (915216) and (915217), all secondary deposits formed through various episodes of silting.
- 7.2.282 Sub-circular feature [915212] was thought to be a tree bowl due to its irregular shape.

8 Finds Assessment

8.1 Pottery, Ceramic Building Material and Fired Clay (Appendix 6)

Pottery

- 8.1.1 There were 1353 sherds, 12831g including 105 rims, and 55 bases of pottery presented for assessment. This included 1100 sherds, 11446g, including 81 rims and 51 bases from stratified contexts (excluding topsoil etc.) and 221 sherds, 805g including 6 rims from environmental samples.

8.1.2 The material was studied following the pottery standard (Barclay et al. 2016) and recorded using the Warwick Museum/Oxford Archaeology recording system (Booth 2000). Fabrics were assigned to classes: A (Amphorae), B (Black Burnished), C (Calcareous tempered), E (Early or 'Belgic'), F (Fine wares), G (Gritted wares), M (Mortaria), O (Oxidised), P(Iron age tradition), Q (White slip), R (Reduced), S (Samian), W (Whitewares) and Z (medieval and later). Metrics recorded were number of sherds, (NoSh), weight in grams, (Wt), minimum number of rims, (MNR). Mean sherd weight is calculated by Wt/NoSh. Table 3 (Appendix 6) shows the amount of pottery recovered from each Trench, with significant amounts of pottery in Trenches 7, 8, and 27 and moderately sized groups from Trenches 11, 13, 20 and 25.

Dating

- 8.1.3 Table 3 and Table 10 (Appendix 6) show the date distribution for late iron age (LIA) and Roman pottery with a date span of 150 years or fewer, which excludes the single Middle Iron age (MIA) rim. This suggests three principal periods of deposition: the early to mid-1st century, the 2nd century and the mid to late 3rd century.
- 8.1.4 The earliest pottery is in Class P, Iron Age tradition pottery of probable MIA date. This occurs without any later pottery in pits from Trenches 135 and 142, and ditches in Trenches 025, 043, 060 and 073. A sherd occurs with class E pottery (late 1st century BC – c. AD 70) in ditch (904009) in Trench 040 and residually alongside medieval CBM in ditch (912211). One rim was noted, of a bead rim storage jar in pit (913511).
- 8.1.5 Class E, early ('Belgic') grog tempered wares, provide the evidence for the next period of deposition. This class probably reaches the region by the last decades of the 1st century BC and continues in production until c. AD 70. The group includes probable handmade examples, which probably date to the earlier part of the date range and wheel made fabrics which probably commence in the 1st century AD. These occur without later pottery in Trenches 002, 007, 008, 010, 015, 018, 019, 025, 027, 031, 038, 040, 066, 067, 069, 073, 099, 135 and 148.
- 8.1.6 Contexts with class E pottery alongside post conquest fabrics suggesting a possible mid-1st century date are found in Trenches 007, 008, 011, 013, 015, 020, 025, 035, 040, 067 and 073. Material in this class occurs residually in a number of later deposits. Vessels include a number of everted rim and bead rim jars, a bowl with a grooved rim and a CAM12 dish and a possible CAM63 derived dish. There are also a couple of possible Late iron age to 1st century shell tempered (Class C) jars and a lid.
- 8.1.7 Material with a late 1st to 2nd century date includes a rim from a reeded rim bowl and a dish in probable Verulamium region whiteware, a greyware jar with a bifid rim (as Marney 1989 Fig 30 no 1) and a body sherd from a poppyhead beaker.
- 8.1.8 Material of probable 2nd century date includes central Gaulish Samian decorated body sherd form (901306), grey ware jar (as Marney 1989 fig 31 no 26) from ditch (902010) a flange rim bowl from the same context and a possible BB1 copy jar from pit (900812) with other material occurring residually in Trenches 008, 013, 025. and 027.
- 8.1.9 Mid-2nd to mid-3rd century material is represented by East Gaulish Samian dr31 bowls from ditch (900806) and the topsoil from Trench 013.

- 8.1.10 Mid-3rd century vessels are represented by two incipient bead and flange rim bowls from Trenches 009 and 027.
- 8.1.11 Late 3rd century and later material includes a number of greyware developed bead and flange rim bowls, Oxford red slip (Tomber and Dore 1998 OXF RS) vessels, Oxford whiteware (Tomber and Dore 1998 OXF WH) mortaria pink grog tempers Tomber and Dore 1998 PNK GT jars and a number of Harrold jars (Tomber and Dore 1998 HAR SH). Late third century and later pottery is noted in Trenches 008, 011 013, 015 and 027.

Taphonomy

- 8.1.12 Table 4 (Appendix 6) shows the breakdown of pottery recovered by context type. The majority of material is from ditches, which is indicative of a rural site but there is a large amount of material from pits (39.9% of overall sherd count) which can correlate with industrial activities on a site. There is also a large amount of material from 'feature', most from (902704).
- 8.1.13 For Trenches with more than 50 sherds overall Trenches 007, 08, 020 and 025 exclusively had pottery recovered from ditches rather than other features. Trench 011 only had pottery from pits while Trench 008 also had most of the pottery from pits. Trench 027 has the majority of the material from feature (902704).

Supply

- 8.1.14 Table 6 (Appendix 6) shows the breakdown of the pottery by ware class and Table 7 (Appendix 6) shows the breakdown by ware by Trench.
- 8.1.15 Class B, black burnished ware, occurs at less than 1% with the only vessel being a probable 3-4th century simple rim dish.
- 8.1.16 Class C, calcareous tempered wares, is at 13%, which is in line with what would be expected for a site in the region. There is a small amount of Late Iron age - early Roman material in this fabric but the majority of material is probable of Harrold origin and is late Roman in date.
- 8.1.17 Class E, early or 'Belgic' wares are the strongest group at 34% This includes some early handmade vessels and later wheel made ones.
- 8.1.18 Class F, non-Samian fine wares is at 1%, The majority of these are oxford red slip, with one body sherd of Nene valley colour coat.
- 8.1.19 Class G, gritted wares is at 1% comprises pink grog tempered ware which are late 3rd century + in date, and includes a number of jars. The site is located on the edge of the ware's distribution (Taylor 2004) although it is unusual in terms of presence of jars and the absence of storage jars.
- 8.1.20 Class M, mortaria are at 1% comprising Oxford mortaria, possible Verulamium region (Tomber and Dore 1998 VER WH) mortaria and another whiteware mortaria.
- 8.1.21 Class O is at 10% which is high. This includes possible Oxford products and Verulamium region wares.
- 8.1.22 Class P, Iron A tradition wares, is at 6%, and includes a single storage jar trim.

HS2 Ltd - Code 1 Accepted

- 8.1.23 Class Q is at less than 1%.
- 8.1.24 Class R is at 31%, the second largest group in the assemblage.
- 8.1.25 Class S, Samian is at 1% and has one decorated sherd of central Gaulish Samian and three East Gaulish Dr 31 bowls.
- 8.1.26 Class W, whitewares are at 2%, mainly represented by Verulamium region whitewares.
- 8.1.27 Class Z post medieval pottery is at less than 1%.

Function and fine ware

- 8.1.28 Table 8 (Appendix 6) shows the functional breakdown for the stratified material. Jars (including SJ and WMJ) are at 48% and table wares are at 31% suggesting that this site is at the high end of a rural site. The break down by Trench for groups of more than 10 rims is shown in Table 9. Trench 008 is very much rural in nature at 67% jars to 20% able wares. Trench 027 has slightly lower jar levels at 52% and 37% table wares.
- 8.1.29 Fine ware and Samian levels are at 2%, which suggest a rural site. However, this figure is affected by the large number of early fabrics and the fact most of the fine wares are later in date. This would suggest that the site has a change in status in the mid-3rd century to something that is at least a high-end rural site although perhaps not quite a villa.

Discussion

- 8.1.30 There is a small group of pottery which indicates some Bronze Age activities in the area, notably in the vicinity of Trenches 1 and 135.
- 8.1.31 The absence of any Roman pottery in the vicinity of Trenches 135 and 142 would suggest that the bulk of activities had ceased in this area by the time of the Claudian conquest.
- 8.1.32 Pottery of probable Middle Iron Age and transitional material is diffused across the Site and is consistent with rural activities perhaps originating in the 1st century BC, with occupation continuing into the 1st century AD and into the first decades after the conquest, where the settlement appears to remain largely rural in nature but benefitting from wider contact within the newly Roman province. There appears to be a hiatus in the late 1st to early 2nd century followed by evidence of a more restricted settlement in the mid to late 2nd century, also very much rural in nature. There is very little evidence of any early 3rd century activity, but in the mid to late 3rd century there is a new wave of deposition very much reflecting a higher status site – a high level rural site but perhaps not quite a villa. There is no pottery which is necessarily of 4th century date which suggest occupation ends after the late 3rd century or the early 4th century. Later post medieval deposition is consistent with post medieval rural scatter. A full list of dates is included in Table 10 (Appendix 6).

Potential and Recommendations

- 8.1.33 Full analysis (described in 8.1.33) of this material can directly contribute to the following research objective:

KC13: What was the date of the establishment of Grim's Ditch? What impact did it have on the landscape following its construction?

- 8.1.34 It would also contribute to understanding the dating of the Site, the nature of supply to the Site and its changes from the late Iron age until the late Roman period and the change in status of the site.
- 8.1.35 The stratified prehistoric and Roman material will be recorded to a fabric and form series with rim equivalent and base equivalent being recorded, and aspects such as sooting being recorded. The data will be analysed for the site as a whole as well as by phase and area groups as appropriate, the forms will be most efficiently presented as a drawn type series.
- 8.1.36 The information on the pottery from the Bronze Age feature should be presented in detail alongside any other features of this date to establish the nature of any Bronze Age activity in the wider landscape and to help determine the function of those pits.

Ceramic Building Material

- 8.1.37 There were 1272 fragments, 14193g of material presented for study. This included 871 fragments, 13932g, of ceramic building material (CBM) and 402 fragments, 261g, of burnt clay. The CBM comprised 152 fragments, 13189g, of stratified material recovered as bulk finds and 700 fragments, 286g of material retained from environmental samples. The burnt clay comprises 3 fragments, 15g of stratified material recovered as bulk finds and 400 fragments, 246g recovered as environmental samples.
- 8.1.38 The material was recorded by context with fabrics recorded by a type series and forms recorded where possible. Metrics recorded were number of fragments, (No), weight in grams, (Wt), no of corners, (Cnr). Complete dimensions of length, width and thickness were recorded in mm. Unidentified fragments of CBM were recorded as 'B/T' (Brick/Tile).
- 8.1.39 Table 11 (Appendix 6) shows the occurrence of stratified CBM by Trench, with Table 12 (Appendix 6) showing the occurrence of Roman CBM by Trench. The Roman material is concentrated in the north of the area of investigation with the largest group from Trench 027.

Dating

- 8.1.40 The majority of the CBM was Roman. There was a cutaway of Warry 2006 type c.5 tile from (901111) of mid-2nd to mid-3rd century date. Medieval and later tile were noted in a much wider spread (Trenches 5, 11, 14, 25, 34, 38, 40, 67, 73, 98, 108, 122, 129, 137, 142, and 149), mainly from topsoil.

Taphonomy

- 8.1.41 Table 13 (Appendix 6) shows the break down by context type of all the stratified CBM. Table 14 (Appendix 6) shows the breakdown of Roman CBM only by context type. In a base level rural site, it would be expected that most CBM would come from ditches. High levels of CBM from pits can correlate with industrial activities related to a settlement but have been noted for dumps of material from nearby demolished structures (Mills 2017).

Forms

- 8.1.42 Table 15 (Appendix 6) shows the proportion of all stratified forms and Table 16 (Appendix 6) shows the amounts of Roman forms.

HS2 Ltd / Code 1 Accepted

- 8.1.43 Roman bricks included two examples, one with 36mm thickness and one with 50mm thickness.
- 8.1.44 Flat fragments were CBM that could be flue tile, tegula or brick fragments. Most were around 20mm thick, so probably derived from tegula. There was one example 30mm thick which could be from a brick.
- 8.1.45 There was a small amount of imbrex. These are unusual in rural scatters, and the ratio of tegula to imbrex is in line with a group from a demolished structure (Mills 2013).
- 8.1.46 There was one nail hole in a tegula fragment from (901111).
- 8.1.47 There was no evidence of any flue tile in the group.
- 8.1.48 Table 17 (Appendix 6) shows the break down by Trench for Roman CBM forms. Trenches 007, 008, 025 and to an extent 020 are consisted with scatter with the groups in Trenches 009, 011 and 027 are more in line with what would be expected for material from a demolished structure.

Other aspects

- 8.1.49 There was one fragment with mortar traces (1%) which was the tegula fragment from (901111).
- 8.1.50 Two fragments with signature were noted, a tegula fragment from (901111) with a signature of two parallel fingertip curving lines and a flat fragment with two parallel fingertip formed curving lines.

Discussion

- 8.1.51 The Roman CBM is concentrated in the north of the study area, with most coming from the feature in Trench 027. The amount of material is larger than would normally be found in a basic rural scatter, the presence of imbrex and a number of bricks, which are unusual in such scatters suggest that this material mainly derives from a nearby structure with a ceramic roof. The cutaway suggests a mid-2nd to mid-3rd century date for the roofing of this structure. The presence of bricks but no flue tiles suggest that bricks may have been incorporated into part of the walls of the building, e.g. as a bonding layer, but there is no evidence of a hypocaust. This would suggest that roof comes from a relatively high-status rural building but not a villa – more in the line of a Romanised farm.
- 8.1.52 The medieval and later CBM is scattered around the area of investigation and is consistent with medieval and post medieval rural scatter.

Fired Clay

- 8.1.53 The burnt clay was mainly recovered from environmental samples (Appendix 9) and was in the form of unidentifiable fragments, this was likely the result of burning on the ground.

Potential and Recommendations

- 8.1.54 The Roman material should not be discarded until it has been fully recorded to fabric type. The size of this group and its probable association with a nearby structure means

HS2 Ltd - Code 1 Accepted

that it would be a useful group to publish fully. It would shed light on the nature of supply to the site as well as information about the roman CBM industries in the region.

- 8.1.55 The stratified Roman material should be fully recorded to a fabric type series and analysed as a group as a whole and by phase group. Where possible comparisons should be made with other CBM groups in the region.

8.2 Metal finds (Appendix 7)

- 8.2.1 One hundred and eleven fragments of metal small finds were submitted for assessment. These were recovered from excavation and from topsoil. The finds range from the Late Iron Age or Roman period through to the early modern period. The Late Iron Age and Roman assemblage is modest in number but includes two silver artefacts and a fragment of an iron sword or spear, all of which hint at high status or ritual activity on site or in the vicinity.
- 8.2.2 The assemblage was sorted by material and then examined visually and at x20 magnification where appropriate. Each find was weighed, measured, and entered onto an excel database. Standard reference material and typologies were consulted as was appropriate and x-rays were produced and analysed for selected items.
- 8.2.3 One hundred and eleven fragments of metal were recorded from forty-six contexts (Tables 18 and 19, Appendix 7). The assemblage comprised one item of Late Iron Age or Roman date, 70 of Roman date, one of medieval date, eleven of post-medieval date, thirteen of modern date, and fifteen of uncertain date. The assemblage is discussed below by period and then by material where appropriate. The coin assemblage is discussed separately further below.

Roman

- 8.2.4 Seventy objects of Roman date were recovered from thirteen contexts. The assemblage includes a copper alloy finger ring, sixty-four iron objects mostly comprising nails, two silver artefacts and one item of lead. Three Roman coins were also recovered; these are discussed in a separate section below.
- 8.2.5 Of the sixty-four iron objects found ten were nails of Manning type 1b (Manning 1985, 134). A possible fragment of tool such as a knife was recovered from context (901106), though X-radiography did not aid identification. The remaining items were loops of uncertain function or unidentifiable objects of probable Roman date. One miscellaneous item of lead was recovered which was dated on the basis of other finds from within context (902704).
- 8.2.6 Three incomplete knife blades and one complete folding knife were recovered during excavations at Hunt's Farm. The first is from context (904105). The blade has a flat back and an offset tang. Most of the tang is missing, as is the tip. The blade is likely to fall into Manning's type 15 blades (Manning 1985, 115).
- 8.2.7 The second incomplete knife blade was recovered from the fill (900708) of ditch [900702], (Plate 27) which is thought to be a continuation of the Grim's Ditch Monument. X-radiography demonstrates this belongs to Manning's Type 15 which has a tang set

below the back, and which has slopes down to the blade edge. Type 15 knives are the most common variety found on Roman sites and were in use throughout the period (Manning 1985, 115).

- 8.2.8 The final incomplete blade comes from context (901106) and comprises two fragments which appear to be from the same object. X-radiography reveals the object has an incomplete, bent tang leading into a rectangular blade which then appears to curve gently towards the break. The form of the blade is uncertain.
- 8.2.9 A copper alloy finger ring was recovered from context (900700) (Plate 30). The ring has a flat oval bezel decorated with a pair of circular cells. Each cell contains degraded enamel, but the colour of the enamel is difficult to determine. The hoop is incomplete. Enamelled finger rings of this form date to the second or third centuries and are found on urban and rural sites. The form of bezel is comparable with Henig Type II (Henig 1974, fig.1).
- 8.2.10 Two Roman silver artefacts were recovered, both of which have been reported under the Treasure Act 1996 as potential treasure. A fragment of a silver snake bracelet (Plate 32) was found in context (909300). The bracelet has a flattened lozengiform head which leads to a hoop of rectangular section. A faint incised decoration is visible around the perimeter of the head, but much of it is obscured by corrosion. Cool argues that snake-headed penannular bracelets may not have only been items of jewellery but might also have related to cult practices (Cool 2000, 34). The snake was intimately associated with Asclepius and Mercury with gifts of snake-entwined caducei acceptable gifts at the latter's shrines.
- 8.2.11 A Roman silver earring (Plate 33) was found in fill (902704) of interface [902702]. The earring comprises a single strand of wire, circular in section with incomplete intertwined ends which would have overlapped with the hoop to form a decorative 'knot'. This design of earring is dated to the third century AD and is an example of Allason-Jones Type 3 (Allason-Jones 1989, 5-6, 49, no's 27-28).
- 8.2.12 A large Roman bioconical steelyard weight (Plate 29) was also recovered from fill (902704). The weight has two strands of iron inserted into the centre of the body and which emerge at the top to form a now incomplete loop. The weight has a mass of 837g. It is possible that the weight was intended to approximate to three librae (325g/libra), though it would be somewhat underweight.
- 8.2.13 Sixty-three Roman iron objects were found, of which ten were nails of Manning type 1b (Manning 1985, 134). A possible fragment of tool head (Plate 28) such as from an adze was recovered from context (901106). The remaining items were loops of uncertain function or unidentifiable objects. One miscellaneous item of lead was recovered which was dated on the basis of other finds from within context (902704). A possible knife blade was recovered from (904105) though x-radiography is required to aid further identification.

Medieval

- 8.2.14 An incomplete copper alloy composite strap end of medieval date (Plate 29) was recovered from context (900700). The fragment comprises one of the side plates. Composite strap ends are common finds on urban and rural sites and usually date between the mid-13th to 15th centuries (Egan and Pritchard 2002, 142).

Post-medieval and modern

- 8.2.15 Twenty-five objects dating to the post-medieval or modern periods were recovered, many from topsoil. Eleven are copper alloy buttons of 19th or early 20th century date, some of which bear the makers mark on the reverse. A copper alloy crotal bell was found in context (906900). The bell is globular and has a rectangular loop at the top. The loop shows much wear. The bell has a moulded rib which divides the hemispheres. Two holes joined by a channel are located on the lower hemisphere. The lower hemisphere has incised decoration, but no makers mark is visible. The bell dates to the 17th or 18th century. A copper alloy stud – perhaps from a harness – was recovered from context (909300), and an early modern brooch of pressed metal was found in context (908600). A single lead musket ball probably from a small musket such as an arquebus or caliver was found in context (904600). The musket dates to the 17th or 18th century. A fragment of a gilt copper alloy, possibly a ferrule was recovered from context (913900). The object is decorated on the exterior with a very fine incised band which suggests a post-medieval or later date.
- 8.2.16 Of particular interest is a small toy miniature cannon found in context (914900). The cannon has a rounded cascabel and a prominent concave vent field with a small vent. The barrel is mostly plain with a reinforce ring positioned at the trunnions. The muzzle is of concave. The trunnions are comparatively long and slender. Forsyth and Egan (2005, 80-81) suggest that firing toy cannons were popular by the end of the 16th century, but the majority show features that were developed in the 17th - 18th century. The toy from Hunts Green Farm is likely to date to the first half of the 18th century.
- 8.2.17 Thirty-one fragments of what appear to be from the same object (hence identified in the table as one object) were recovered from context (907313), these were determined to be part of a folding knife. The exterior of the knife is corroded but x-radiography provides further detail. The back of the knife appears to be formed of a frame, possibly of iron, though possibly of copper alloy. The frame is flat and curves downwards at the tip to form a guard. The frame is slightly swollen at the centre point along its length and is possibly riveted or decorated two thirds towards the curved end. Attached to the frame are what appear to be two slender iron blades, each overlapping in the centre. Both appear to be riveted to be riveted to a central place at either end. The knife does not comfortably fit any of the known Roman forms. Given that the pit it was recovered from also contained medieval and post-medieval finds, it is likely that this folding knife is of post-medieval or perhaps even early modern date.

Undateable

- 8.2.18 Fifteen objects of uncertain date are described, weighed, and measured in the master archive list. Dating of the objects might be inferred from other evidence recovered from their contexts. One object warrants mention within this group – a piece of lead casting waste with what appears to be charcoal or iron flecks within its matrix. Although the form and context of the object offers little in terms of dating, it is possible that the lead artefact is indicative of metalworking on site or in the vicinity.

Coin

- 8.2.19 Ten coins were recovered from ten contexts (902900), (903500), (912000), (901600), (903900), (900700), (902700), (904900), (907700), (902800). Three are Roman, four are

HS2 Ltd. Code Accepted

post-medieval, one is post-medieval or modern, and one is modern. The remaining coin is of uncertain date. The Roman coins are worn and largely illegible. The post-medieval and modern coins are also worn but legible. The coins are as follows:

Context (900700). Roman copper alloy as or dupondius, struck AD43-250. Illegible ruler. Obverse and reverse illegible. Diameter 25mm. Weight 8g.

Context (901600). Pierced silver penny of James II, dated 1686. Diameter 12mm. Weight 0.4g.

Context (902700). Roman copper alloy as, uncertain ruler. Obverse and reverse illegible. Diameter 21mm. Weight 5.2g.

Context (903900). Copper alloy dodecagonal threepence of George VI, dated 1942. Bust left, [GEORGIVS VI D G BR OMN REX F D IND IMP]. Thrift plant, THREE PENCE 1942. Diameter 21mm. Weight 6g.

Context (903500). Copper alloy halfpenny of George II (1727-60) or III (1760-1820). Illegible. Diameter 28mm. Weight 8g.

Context (903900). Silver sixpence of George III. Struck 1817. Diameter 19mm. Weight 2.37g.

Context (904900). Illegible Roman copper alloy As. Obverse and reverse illegible. Struck AD43-250. Diameter 24mm. Weight 7g.

Context (912000). Copper alloy halfpenny of George III (1760-1820). Diameter 30mm. Weight 10g.

Context (907700). Flat copper alloy circular disc with no detail. Possibly a coin or token. Diameter 12mm. Weight 0.4g.

Context (902800). Flat copper alloy circular disc with no detail. Possibly a coin or token. Diameter 14mm. Weight 1g.

Discussion

- 8.2.20 The metal finds assemblage from Hunts Green Farm demonstrates activity from at least the Late Iron Age, with hints of high-status activity in the Roman period. The presence of two silver items of jewellery is somewhat unusual considering the absence of other forms of Roman jewellery such as copper alloy brooches and pins which are common on Roman rural settlements. The assemblage is too small to infer much from this, however. Similarly, it is difficult to infer much from the small quantity of Roman nails and other ironwork.
- 8.2.21 No finds were recovered that attest to the period AD410 to circa 1250, though this should not be taken as evidence for abandonment of the site. Post-medieval and modern finds are possibly the result of dumping or the spreading of manure or shoddy within the agricultural hinterland of a post-medieval/modern settlement. The post-medieval and modern finds are of low archaeological potential.

Potential and Recommendations

- 8.2.22 The iron spear/sword/knife tip from context (900708) should be x-rayed to show the plan and the section more clearly. Further study should be undertaken by a finds specialist once the x-radiography has been undertaken. Given that this object was recovered from the hypothetical continuation of Grim's dyke, it is possible that it could contribute towards research question:
- KC13: What was the date of the establishment of Grim's Ditch? What impact did it have on the landscape following its construction?*
- 8.2.23 X-radiography is also required for the iron loop from (902704), the possible tool from (901106) and the possible knife from (904105). X-radiography is also required to aid identification of the twisted wire object from context (907313).
- 8.2.24 The silver earring and bracelet should be reported as potential treasure under the stipulations of the Treasure Act 1996. No further research is recommended on other parts of the archive.
- 8.2.25 The archaeological finds should be kept as part of the archive. The obviously modern material could be disposed after consultation and agreement of all relevant parties.

8.3 Lithics

- 8.3.1 A total of 105 pieces of worked flint (weighing 1198g) and 183 pieces of burnt unworked flint (weighing 300g) were recovered during the archaeological investigations at Hunts Green Farm (Table 21). The worked flint was recovered from 31 contexts, with most contexts containing only a few pieces. The only significant concentration of struck flint was in context (902704), which contained 41 pieces recovered from sieved residues. A total of eight flints were recovered from eight test pits (a single flint in each).

Table 21 Summary of flint

Flint category	Total	Total weight (g)
Flake	26	251
Blade	2	18
Blade-like flake	11	64
Bladelet	2	2
Irregular waste	2	14
Sieved chips	55	11
Bipolar (opposed platform) blade core	1	51
Bladelet core with one platform	1	92
End scraper	1	22
Single platform flake core	1	
Other heavy implement	1	
Total	105	1198
Burnt unworked	183	300

- 8.3.6 Theconditionoftheworkedflintisgood,withmostpiecesremaininginafresh condition, and just 13 pieces showing slight post-depositional damage, such as chips to vulnerable unretouched edges. Most of the assemblage remains unaffected by surface alteration, however varying degrees of cortication were present on 14 pieces. Excluding sieved chips, just six pieces were broken and four are burnt.

Potential and Recommendations

- 8.3.7 TheworkedflintfromHuntsGreenFarmcontainstechnologicalcharacteristics consistentwithaMesolithicorEarlierNeolithicdate,howeverwithoutthepresenc eof chronologically diagnostic tools, the suggested date cannot be confirmed or refined. Thesignificanceoftheflitassemblageliesinitsdemonstrationofhumanactivityatthesite duringprehistory, potentiallyduringtheMesolithicorEarlierNeolithic

8.3.8 The 'other heavy implement' with the natural perforation from Trench 135 should be looked at in more detail and compared to other examples with known functions. The assemblage should be included alongside any future work.

8.4 Stone

8.4.1 A total of 11 Fire Cracked Rocks (FCR) and one worked stone weighing 1,355 grams. The stones (Table 21) were all collected from the same field.

Table 23 Summary of stone type by context

Context	Trench	Rock Type	Rock Shape	FCR-Type	Heating	Quantity	Weight	Discoloration	Comments
900814	8	Quartzite	Cobble	Block	Direct fire	10	814g	maroon	Heavily fragmented
901309	13	Slate	Tabular	-	-	1	72g	-	One corner worked
906107	61	Quartzite	Cobble	-	Direct fire	1	469g	maroon	Complete

Methodology

8.4.2 The assemblage has been examined in detail by Raquel Margalef, following standards and guidelines from stone specialist Ruth Shaffrey, ground stone analysis from Jennifer Adams (2014) and "The study of Fire-cracked Rock and its Archaeological Research Potential" from Tommy Ng (2004). As a result, the stones were catalogued by the following attributes:

- Rock typology: material identification.
- Shape3: catalogued in three typologies: Tabular: when the stone has a flat or rectangular morphology, Block: when the stone has a cuboid structure, not necessarily symmetric and Cobble: when the stone has a rounded or pebble-like shape.
- FCR type: There are five categories: Spall4, Chuck5, Crenellated6, Pot-lid7 and Block8. It identifies short term or multiple uses in contact with direct or indirect heat.
- Heating: Classify direct firing such as hearth or, heat and water-cooling processes such as boiled stones.
- Size: can elongate or reduce the live durability of rocks.
- Discoloration: interior and exterior colour changing on the stone based on intensity and re-use fires.
- Concerning the fire affected stones, the attributes above were included in order to determine stones' resilience and its anthropic use.

Provenance and condition

8.4.3 The assemblage derives from three different contexts associated with two pits and one ditch. The condition of the stones was good and only one example was found complete within (906107).

8.4.4 One item was discarded from deposit (904305) due to its natural condition.

Assemblage

8.4.5 The whole assemblage contained a total of 10 FCR and one worked stone, comprising Quartzite of fine and coarse grains (Table 21) and slate. The items from context (906107) and (900814) have suffered from heating episodes displayed on its type of fracture, block, and its maroon discolouration. Particularly, the stones from context 900814 showed heavy fragmentation, which suggest multiple firing episodes in an oxidised atmosphere. The fragments were collected from:

- A secondary fill (901309) of a large ditch (901307) yielded one incomplete worked slate. The fragment measured 8.1x4.6x1cm, and had no visible burn affected traces on its surface. The finds recovered in this context included Roman pottery, slag and discarded burnt/fired clay.
- Collected from the third fill (900814) of a large pit [900811]. A total of ten Quartzite stones, heavily fragmented with purple discolouration, were found. No traces of any other archaeological artefacts were associated with the feature.
- Finally, a single fill (906107) of a pit [906106] revealed one complete pebble of 10.5cm long, 6.5cm wide and 4cm deep. On the smallest corner of the stone, within an area of approximately 5cm, maroon discolouration was detected, which suggests direct contact with fire. Observed on the surface of the stone, the remains of a possible damaged area with white stain patches were detected. This could correspond to possible fatigue wear which consisted of the collapse and crushing of two surfaces when they moved against each other creating visible damage. The damaged areas displayed peck marks (little pits and fractures) related to that type of wear. It was also noted the presence of two parallel areas of adhesive wear, also called prehensile wear, caused by the contact of two surfaces, even if there is no movement (Adams 2014, 132). Six possible fragments of Prehistoric pottery and a low density of charcoal were present within the same fill.

8.4.6 The assemblage observed suggests a very diverse anthropic landscape from a multi-period site. In spite of the collection of FCR from two features, both events should be analysed separately.

8.4.7 Context (900811) yielded a total of ten FCR. The stones were parched on multiple occasions, displaying smooth breakage surfaces. This type of fracture, also known as expansion-fracture, was mostly caused by direct heat from a hearth or a furnace. The exterior of the stone received the shock by the direct fire, but its interior remained cooler which led to the expansion of the stone by breaking, and consequently to flat, convex, or concave breakage faces that are smooth (Neubauer 218:683). They were associated with slag and charcoal that may help determine its industrial character rather than domestic. It has been noticed that the stones did not show previous marks of usage, and the pit was absent of burnt soil. As a result, it might indicate that the stones were probably collected for one purpose (fire event) and later re-located to waste deposits.

8.4.8 The most interesting item was a complete quartzite stone found in context (906106). The multiple wear marks displayed on its surface, in conjunction with the heat affected area,

classified this object as recycled. For an unknown explanation, as the stone appeared in a very good condition, the primary function as a possible ground stone, was no longer needed, and the object was applied for a new role. As the stone did not suffer from any intended redesign, after discarded of its primary function, it was catalogued as a recycled item, instead of a re-used item (Adams 2014). Concerning its primary function, the different wear marks located on its surface manifested how the object was probably treated. As mentioned earlier, two parallel adhesive wear marks were found on the stone. These evidences result from molecular interaction of two surfaces that established a bond and a break or disruption, through separation. This interaction could be seen as the act of handling the object itself over the use of the thumb and the middle finger. As for the fatigue wear, its location, in the centre of the smoothest face, and its shape, an oval area, showed that the item was in contact with an oval object. No visual traces were detected by the naked eye and only further analysis will determine the remains of any interaction that the stone had. Both frictions, adhesive and fatigue, revealed the object as active, instead of passive or receiver of the movement.

- 8.4.9 Finally, the stones were found within a pit associated with a low density of charcoal and six fragments of possible prehistoric pottery. Thereby, it was indicative of a multi-state feature from a single use, meaning that the stones were probably collected for one purpose (fire event) and later re-located to waste deposits.
- 8.4.10 The use and display of Fire Cracked Stone or Thermally affected stones were the result of fire by-products; fuel that based on the size, type or weight of the stone keep the heat longer and stable for multiple occasions (Adams 2014;2014a). FCR could also be associated to the intended action to exhaust its components in order to produce mortar, pottery, or metalwork. These artefacts are difficult to date without the assistance of secondary archaeological material or further analysis.
- 8.4.11 A single rectangular uncomplete fragment of slate was yielded from context (901307). Slate stones or cleavable rocks are metamorphic rocks mostly located on the western and north-west part of England (Hugues 2003:32). The extraction of these stones from quarries, especially for roofing, was an industry that started during the Roman invasion of Britain, reappeared on the thirteenth/fourteenth century and spread throughout our times (Hugues 2003:35; 2005:25-26). The single fragment of slate was collected with Roman pottery, slag and discarded burnt/fired clay from the upper fills of a possible prehistoric ditch. Accordingly, the piece might probably appear as the action of disposal waste material from a possible industrial episode. Also, the location of one single fragment may emerge as residual.
- 8.4.12 The study of this assemblage and technology enables us to explore the social behaviour of specific communities (Rowan and Ebeling 2016: 213) and expand our understanding of an understudied material, such as FCR. The significance of this assemblage relies on its ability to illustrate the use and recycled of thermally affected stones and how these were re-located to waste deposits.

Potential and Recommendations

- 8.4.13 Further assessment or analysis would not increase our understanding of this assemblage and would not therefore contribute to the understanding of the local area or broader region. Although if additional research on site is performed, any material or features

found in the surrounding area of the recycled stone tool, from context (906106), should be subject to re-evaluation with the new data collected.

- 8.4.14 There is no apparent reason for the retention of these stone fragments and the material could be discarded. In the event that they were retained, there are no specific requirements for the long-term storage of these materials.

8.5 Slag (Appendix 9)

- 8.5.1 A very small assemblage (just under 6kg) was recovered by hand on site and from samples processed afterward (Table 24 and Table 25, Appendix 9). The material was extremely fragmented and had obviously suffered re-deposition.
- 8.5.2 For this report it was examined by eye and tested with a magnet. The material was categorised on the basis of morphology; the magnet was used to test for iron-rich material and detect smithing micro-slags in the soil adhering to slags. Each slag or other material type in each context was weighed except for the possible smithing hearth bottoms, which were individually weighed and measured for statistical purposes. Quantification data and details are given in Appendix 8 (Table 23) in which weight (wt.) is shown in grams, and length (len.), breadth (br.) and depth (dp.) in millimetres.
- 8.5.3 Activities involving iron can take two forms, smelting or smithing. Smelting is the manufacture of iron from ore and fuel in a smelting furnace. The products are a spongy mass called an unconsolidated bloom consisting of iron with a considerable amount of slag still trapped inside, and slag (waste).
- 8.5.4 Tap slag is a dense, low porosity, fayalitic (iron silicate) slag with a 'ropey' flowed structure (it usually resembles thick lava flows). It is formed as the liquid slag is allowed to flow out, continuously or intermittently, through a hole in the furnace side into a specially made channel leading to a hollow in the ground. This removal of the slag facilitated retrieval of the bloom after the smelting operation. Furnaces with tap holes replaced bowl furnaces and slag pit furnaces in Britain as their efficiency was recognised early in the Roman period.
- 8.5.5 Dense slag is of low porosity like tap slag but lacks the flowed surface; it too represents smelting activity. Run slag is what its name suggests and was produced by smelting; it can be produced by smelting in slag pit furnaces or tapping furnaces. If tap slag is very fragmentary it can be hard to identify as such and the term 'run slag' has been used in these instances. Other smelting slag recovered had no clear morphology and has been described as furnace slag in the spreadsheet.
- 8.5.6 A fragment of ferruginous-coloured, sandy rock was found amongst the smelting slag from (902510). It will require geological identification by a specialist who has knowledge of ore types used in the past.
- 8.5.7 Smithing involves the hot working (using a hammer) of the bloom to remove excess slag (primary smithing) or, more commonly, the hot working of one or more pieces of iron to create or to repair an object (secondary smithing). As well as bulk slags, including the smithing hearth bottom (a plano-convex slag cake which builds up under the tuyère hole - hottest part - where the air from the bellows enters the hearth), smithing generates micro-slags; these can be hammerscale flakes from ordinary hot working of a piece of

iron (making or repairing an object) and/or tiny spheres from bloom smithing or high temperature welding used to join or fuse two pieces of iron. Hammerscale, because of its tiny size, is usually only recovered by taking soil samples from fills and deposits but it is very magnetic and its presence can be detected using a magnet; it is most prevalent (thickest) in archaeological contexts in the immediate area of smithing, i.e. in the vicinity of the anvil and between it and the smithing hearth. In the Hunts Green Farm material it is redeposited.

- 8.5.8 Slag described as undiagnostic cannot be assigned to smelting or smithing either because of morphology or because it has been broken up during deposition, re-deposition or excavation.
- 8.5.9 Other types of debris in an assemblage may derive from variety of high temperature activities - including domestic fires - and cannot be taken on their own to indicate iron-working was taking place. These include vitrified hearth lining and cinder. If found in association with iron smelting and/or smithing slag they are almost certainly products of the process.
- 8.5.10 Hearth lining may vary from highly vitrified, nearest the tuyère region (the region of highest temperature), to burnt clay on the side furthest from heat. By itself it is not diagnostic of industrial activity unless associated with other diagnostic material.
- 8.5.11 Ferruginous concretions are made up of a re-deposition of iron hydroxides (rather like iron panning), enhanced by surrounding archaeological deposits, particularly if there is iron-rich waste present as a result of iron working.

Discussion and significance

- 8.5.12 Although small and representing redeposited material in ditches and pits, the assemblage is indicative of both smelting and smithing activity having taken place on a limited scale somewhere on the Site in the past. The current dating for features in which most slag was found is Roman period.
- 8.5.13 At the present time, the assemblage is of local importance due to its limited quantity and redeposited nature.

Potential and Recommendations

- 8.5.14 Examination of material from Phase 2 of the site has yet to take place and any recommendations for further work on the Phase 1 assemblage will depend on the significance or otherwise of the Phase 2 slag.
- The only recommendation at the present time is identification of the possible iron ore by a geologist with experience of ancient iron ores.

8.6 Palaeoenvironmental (Appendix 10)

Method Statement

- 8.6.1 The work recorded a small number of features of probable prehistoric date along with ditches, pits and other discrete features of Roman date and additional unlocated contexts. Samples for the retrieval of the plant macrofossil assemblages were taken from across

the excavated area, with a total of 81 being submitted for assessment from the evaluation and a further 19 from the Trench 135 and 142 Extensions; 100 in total.

- 8.6.2 The samples were processed by manual water flotation/washover and the flots were collected in a 300 micron mesh sieve. The dried flots were scanned under a binocular microscope at magnifications up to x 16 and the plant macrofossils and other remains noted are listed in Table 26 – 30 (Appendix 10). Nomenclature within the Tables follows Stace (2010). All plant remains were charred. Modern roots, chaff, stem fragments, seeds, fungal sclerotia and arthropod remains were present or common within most of the assemblages studied. Sample <7300> (from un-dated pit [907310] contained a high density of material which appeared scorched rather than charred. In this instance, only plant remains which were fully charred were included within the current report.
- 8.6.3 The non-floating residues were collected in a 1mm mesh sieve and sorted when dry. All artefacts/ecofacts were returned to INFRA for further specialist analysis and are discussed in the relevant specialist sections of this report.

Results (Figures 10, 11 and 12)

- 8.6.4 Charred cereals, chaff, seeds and nutshell/fruit stone fragments are present within thirty-six of the assemblages studied, although mostly at a low to moderate density. Preservation is variable; some macrofossils are very well preserved, but others are very fragmented/abraded. Many of the cereal grains are severely puffed and distorted (probably as a result of very high temperature combustion), with specimens from sample <1103> (Roman pit [901103]) being especially tarry with an almost melted appearance.
- 8.6.5 Cereal grains are generally scarce. The majority of the identifiable specimens are of wheat (*Triticum* sp.), with a single elongated 'drop-form' grain of possible spelt wheat (*T. spelta*) type being noted within sample <1102> from Roman pit [90110]. Spelt glume bases are also present within fourteen of the assemblages studied. Individual grains of oat (*Avena* sp.) and barley (*Hordeum* sp.) are recorded from Roman pit [901103] sample <1100> and sample <1102> respectively, but both are very poorly preserved. The only potential non-cereal crop plant remains recorded are two fragmentary large legumes of possible pea/bean type (Fabaceae), one from Roman ditch [902502] sample <2501> and one from pit [90110].
- 8.6.6 Weed seeds are exceedingly scarce, with all occurring within the Roman ditch and pit fills. All are of common vegetal weeds/grassland herbs, with taxa noted including brome (*Bromus* sp.), cornflower (*Centaurea* sp.), goosegrass (*Galium aparine*), nipplewort (*Lapsana communis*), ribwort plantain (*Plantago lanceolata*), grasses (Poaceae) and dock (*Rumex* sp.). The only wetland plant macrofossil recorded is a single sedge (*Carex* sp.) nutlet from pit [901103]. Small pieces of hazel (*Corylus avellana*) nutshell are noted within ten assemblages and other tree/shrub macrofossils include a damson (*Prunus domestica* ssp. *insititia*) fruit stone (sample <6800> from un-dated context (906804)) and a hawthorn (*Crataegus monogyna*) seed and cherry (*Prunus avium*) pit from un-dated pit [907310] sample <7300>. Highly comminuted charcoal/charred wood fragments are present throughout, although rarely at a very high density. Occasional larger pieces are also recorded. The charcoal within samples <5400> (un-dated post-hole [905403]), <6700> (Roman post-hole [906703]) and un-dated context (907705) sample <7700> has a

very distinctive flaked appearance which is almost certainly indicative of very high temperature combustion.

- 8.6.7 Other remains are present within most of the assemblages studied. The pieces of black porous and tarry material are mostly thought to be derived from the high temperature combustion of organic remains. However, some fragments are distinctly hard and brittle, and it is thought most likely that these are bi-products of the burning of coal. Small pieces of coal (coal 'dust') are present within all but twenty of the assemblages studied. It is currently unclear whether this material is related to Roman 'industrial' activities occurring on the site (see below), or whether some may be intrusive from later deposits either night soil or the modern use of steam implements on the land. Small pieces of heat shattered stone are also relatively common, with most occurring towards the northern end of the excavation area. Other remains include ferrous hammer scale and spherules (again, largely concentrated with the northern excavation Trenches) and occasional small bone fragments.

Discussion

- 8.6.8 For the purposes of this discussion, the samples have been divided by date and context type.

Prehistoric features (Table 26, Appendix 10)

- 8.6.9 Twenty-four samples were taken from contexts of probable pre-Roman date, one from ditch [906002], two from pit [913510], two from pit [914204] and the remainder from the Trench 135 Extension works, from pits and post-holes and a large discrete feature. Although charcoal/charred wood fragments are present throughout, other plant remains (namely, two wheat glume bases and a fragment of hazel nutshell) are very scarce, with all occurring within the fills of pit [914204] (samples <14201> and <14202>). Such sparse assemblages are generally typical of material of prehistoric date and may be derived from scattered hearth waste.
- 8.6.10 Although charcoal/charred wood fragments are present throughout the Trench 135 Extension samples, other plant macrofossils are exceedingly scarce and occur within only two of the assemblages studied. Preservation is very poor and it would appear that all materials may have been burnt at very high temperatures. Sample 13507 from context (913531) includes a spelt wheat (*Triticum spelta*) glume base, three wheat (*Triticum sp.*) spikelet bases and four indeterminate cereal grains. Sample 13515 from context (913554) includes a possible wheat grain, a further spelt glume base and what appears to be a wheat rachis internode. Much of the charcoal is comminuted and numerous fragments are also rounded and abraded, possibly suggesting that the material was exposed to the elements for extended periods of time prior to inclusion within the feature fills. In addition, many fragments are heavily coated with natural iron concretions including some small grits. Small splinters of heat shattered stone are common/abundant within six assemblages from Trench 135 Extension, but the reason for their presence is currently unclear.

Roman ditch fills (Tables 27 and 28, Appendix 10)

- 8.6.11 Thirty-four samples were taken from the fills of ditches within the northern excavation area. Most of the recovered assemblages are relatively small (i.e. mostly <0.1 litres in

volume) and sparse, but some do merit further discussion. Sample <700>, from boundary ditch [900702], is particularly charcoal rich, although other plant remains are scarce. However, the flot also contains a moderately high density of ferrous hammer scale which may indicate that there was some smithing activity occurring in the near vicinity. The assemblage also contains a moderate density of coal. Further coal rich assemblages include samples <1301> and <1303> (both from boundary ditch [901307]) and <6605> (from boundary ditch [906604]). Sample <1304> from boundary ditch [901305] includes a high density of charcoal along with chaff and seeds which are probably derived from cereal processing waste. Such material was frequently used as tinder, kindling or fuel within both domestic and industrial hearths and ovens. Similar material is also noted within samples <1502> and <1503> (from ditch [901507]), <2002> and <2003> (from ditch recut [902017]) and <2501> (ditch [902502]).

Roman pit fills (Table 29)

- 8.6.12 The ten assemblages from pit fills of Roman date include the highest densities of plant materials noted from the trial trench samples. Sample <1102> (from pit [901110]) is particularly diverse including cereals, chaff and seeds of both grassland herbs and marginal wetland plants. Small grass fruits are particularly abundant and it is tentatively suggested that the material may be derived from burnt hay, bedding or fodder. As silica skeletons of cereal awn are also recorded, it would appear that the material was burnt at a high temperature in well oxygenated conditions, possibly within a bonfire. The presence of burnt soil concretions within the same assemblage may indicate that burning occurred in situ. Samples <803> (pit [900811]) <1103> and <1104> (both from pit [901103]) contain assemblages similar to those from the ditch fills, that is containing probable cereal processing waste which may have been used as fuel. Sample <1104> also includes a moderate to high density of heat shattered stone, another probable indicator of high temperature combustion, possibly within an 'industrial' context.

Other Roman features

- 8.6.13 The two samples are from interface [902702] (sample <2700>) and post-hole [906703] (sample <6700>). Both assemblages are charcoal rich, but other remains are scarce. However, it is noted that the charcoal within sample <6700> is very flaked and, therefore, possibly derived from an episode of very high temperature combustion.

Un-dated ditch fills (Table 30, Appendix 10)

- 8.6.14 Thirteen samples are from features which have little or no dating evidence. All contain charcoal/charred wood, but other remains are scarce. However, samples <201> (ditch [900207]) and <202> (ditch recut [900210]) both contain moderate to high densities of heat shattered stone and coal, with sample <201> also including some ferrous hammer scale. It is, therefore, suggested that these materials may be associated with the Roman smithing/'industrial' activities noted within the same north-eastern area of the excavation. Samples <6701> (ditch [906705]) and <6703> (ditch [906709]) both contain high densities of charcoal, much of which has a very distinctive flaked appearance (see above). It currently unclear whether this material may represent a distinct dump of refuse to the south of the Roman focus, or whether it is more closely associated with possible prehistoric activity occurring within the area of Trench 060.

Other un-dated features (Table 31, Appendix 10)

- 8.6.15 The seventeen assemblages are all from pits, post-holes and other discrete deposits. Plant macrofossils other than charcoal are scarce, but the following points may be of note. Sample <1800> from pit [901803] contains a very high density of ferrous hammer scale. The pit is located circa 100 metres to the west of the main focus of 'industrial' activity and it is, therefore, possible that it is associated. Sample <6800> (context 906804) is from an area of root disturbance, possibly implying that there is an unknown degree of disturbance within the deposit. However, the assemblage is very charcoal rich and it also contains the remains of gathered foodstuffs (hazel nut and damson) along with some pieces of heat shattered stone. Although far from conclusive, these remains could be associated with the prehistoric (possibly Bronze Age) activity which appears to have been occurring nearby (cf. Trench 060). The same may also be true for the charred fruit stone and nutshell present within sample <7300> (pit [907310]), although in this instance, it was noted that intrusive material was definitely present within the same assemblage.

Summary

- 8.6.16 In summary, even though the assemblages from Hunts Green Farm are mostly small (i.e. <0.1 litres in volume) and sparse, a number of conclusions may be drawn.
- 8.6.17 Evidence for prehistoric activity is scarce but appears to be centred on an area to the south east of the northern excavation area (Trench 060), with a further focus towards the southern edge of the southern area (Trenches 135 and 142). The plant remains from features of this date appear to be largely derived from scattered hearth waste, with evidence from Trenches 054 and 067 possibly indicating some high temperature combustion.
- 8.6.18 During the Roman period, it would appear that there was a focus of 'industrial' activity (possibly smithing) in the north-eastern area of the Site, particularly concentrated around Trenches 007, 008, 013, 015, 020 and 025. Ferrous hammer scale is recorded along with occasional spherules and the plant remains are almost certainly derived from the use of chaff and/or dried herbage as tinder, kindling or fuel. There is nothing within the current assemblages to suggest that cereal processing was occurring nearby, but evidence from other contemporary sites across Britain does appear to indicate that processing waste was probably being traded as fuel (cf. Van der Veen, 1999).
- 8.6.19 It is possibly of note that small pieces of coal are also more common within the same north-eastern area, potentially indicating that coal was also being used as fuel.
- 8.6.20 One notable assemblage is that from pit [901110] (Trench 011) which appears to be derived from burnt hay or bedding. Although it is currently unclear how or if this material is associated with the above-mentioned detritus, it is tentatively suggested that there may be a link between smithing activities and animals stabled nearby.
- 8.6.21 Environmental indicators are very scarce, but it would appear that chaff, fodder and possibly timber were probably being imported from areas to the east and west of the site which comprise fertile clay loam and loam soils conducive to both agricultural production and forest growth.

Potential and Recommendations

- 8.6.22 Full recommendations for further work will be given when the trial trenching work within Field H is completed. However, it is currently strongly recommended that further investigations are undertaken within the northern area of the Site so that the activities occurring there can be clearly understood. If area excavation is undertaken, additional plant macrofossil samples of circa 40 litres in volume should be taken from all dated features.

8.7 Faunal Bone

- 8.7.1 A total of 129 animal bones or bone fragments were recovered from eight contexts. The assemblage assessed included both hand-collected material and remains from sorted bulk sample residues (Appendix 10).

Methodology

- 8.7.2 Bone was identified using reference works (e.g. Schmid 1972) and comparison material, as appropriate. Countable, measurable and ageable bones were recorded following the Historic England guidelines of best practice (2014).
- 8.7.3 The material was generally very fragmented and of variable - but typically poor - preservation. Calculation of the number of identifiable specimens (NISP) was considered but because of the state of preservation, would not have given meaningful results. There was little or no evidence of butchery, pathology or gnawing.

Results

- 8.7.4 The only species that could be positively identified was cattle, represented by a tibia from context (901113). This bone is in a robust condition, though the proximal end has been lost to fresh breaks. The contrast of its condition in comparison with the rest of the assemblage suggests that this bone context (901113) was deposited or disturbed relatively recently.
- 8.7.5 The assemblage recovered from context (909303) comprises 47 foetal or neonate artiodactyl bones, including a metatarsal shaft and phalanges. Judging from the size, these are likely to be from a lamb or kid rather than a larger animal. There are at least three similar pieces in the bulk sample <9301> residue from this context.
- 8.7.6 From context (913578) fill of pit [913577] two fragments of large mammal long bone and four fragments of unidentified animal bone were recovered but the remains were unidentifiable beyond size category.
- 8.7.7 Two groups of tooth fragments are present in the assemblage, from contexts (908005) and (909007). In both cases, the dentine has been lost, leaving separate plates of enamel. The three fragments from context (909007) are probably from a single cattle molar; the 14 fragments from context (908005) are more likely to be from horse cheek teeth, although it is not easy to readily identify them in their current condition. Sample <801>, from context (908005), produced several small tooth fragments of similar appearance.
- 8.7.8 The condition of these teeth illustrates the aggressive soil conditions at this site, which appear, more generally, to have not been not conducive to preservation of skeletal material.

- 8.7.9 Burnt bone fragments were recovered from samples <2700> (902704), <9301> (909303) and <4000> (904707).
- 8.7.10 Unburnt bone fragments include a piece of possible horn core from sample <900> context (900906).

Discussion

- 8.7.11 The composition of this small assemblage has seemingly been determined largely by local preservation conditions in the soil and probably bears little relationship to the original depositional composition.

Potential and Recommendations

- 8.7.12 The value of this assemblage for any further research is severely constrained by its limited size, the generally fragmented condition of much of the bone, and the likelihood that its composition reflects taphonomic conditions rather than that of the burial assemblage.
- 8.7.13 The cattle bone from context (901113) would be potentially measurable, but cattle tibiae are not routinely measured (Von den Driesch 1976, 87).
- 8.7.14 Further analysis would not enhance the limited information already established, and no further work is recommended.

9 Assessment and Interpretation of Results

- 9.1.1 The results of the Trial Trench Evaluation identified archaeology or possible archaeology in 98 Trenches out of 151.
- 9.1.2 The earliest activity on Site was indicated by the presence of broadly dated prehistoric worked flint, some of which may be contemporary with the construction of the Grim's Ditch Monument. However, other struck flint appears to be more likely of Mesolithic or Early Neolithic date. There were no features identified as belonging to these periods, the flint occurring residually in later features.
- 9.1.3 The earliest prehistoric pottery sherds collected from features within the Site appeared to be of Bronze Age date seen in a localised area to the south and possibly associated with heating activities.
- 9.1.4 Pottery of Middle Iron Age date, although not recovered in any great quantities reflects the activity from this period. The MIA pottery occurred mostly residually within later features and with the only identifiable focal point of Middle Iron Age activity being, again to the south around the same location within the Site. Only four isolated and discrete features were identified that could be firmly dated to the Middle Iron Age, suggesting that activity within the Site during this period was generally limited.
- 9.1.5 Grim's Ditch, although segmented, is thought to have been part of a single coherent system of land division or demarcation, extending across the top of the Chiltern Scarp. A potential continuation of Grim's Ditch, to the immediate north-east of the extant (Scheduled) earthwork, could be indicated by the presence of a large ditch that was

identified in Trench 066, possibly continuing into Trench 055 where it appeared to terminate or turn. A second, perhaps less convincing continuation might be represented by the feature in Trench 059 although this appears to be on a somewhat different alignment.

- 9.1.6 The ditch section recorded in Trench 066 would appear to correlate with a shallow banked earthwork identified in a geophysical survey and remote sensing (LiDAR) survey undertaken as part of the HS2 baseline assessment. The results of the survey shows that the earthwork continues and likely terminates some 40m north-east of the Scheduled Monument boundary and appeared to corroborate the evidence for a north-easterly continuation, as depicted on the 1878 Ordnance Survey map, which shows the earthwork continuing for approximately 35m beyond its current extant limits in an alignment towards King's Lane (Grims Ditch Information Paper, Doc Ref: C252-ETM-EV-REP-020-000121_P02). It is clear that the ditch in Trench 066, along with the survey evidence, does indicate the presence of a ditch and former earthwork continuing north-east of the monument. However, given the segmented nature of the monument as a whole, and given that the pottery dating recovered from Trench 066 was all Roman and from its upper fills, it is also possible the evidence belongs to a much later addition to the monument, unrelated to the original function of the Ditch monument.
- 9.1.7 The large ditch evidenced in Trenches 007, 013, 020, 025, 031 and 040 could also be interpreted as a further north-eastern continuation of the Grim's Ditch Monument. Its size was not dissimilar to the putative continuation seen in Trenches 066 and 055. The remote sensing (LiDAR) survey identified a possible ditch and bank earthwork adjacent to King's Lane in Rushmore Wood, 420m to the north of the Scheduled extant of the monument and it has been speculated that this could be a continuation of the monument, and that its presence adds weight to the possibility that King's Lane follows the monuments alignment further north-east of the Site. The ditch recorded in Trenches 007, 013, 020, 025, 031 and 040 would appear to align with and fit part of the gap between the Grim's ditch monument and the possible ditch and bank identified in the LiDAR survey in Rushmore Wood. However, the nature of the ditch and bank earthwork in Rushmore Wood would need to be proved by excavation and whilst it could be associated with the ditch identified in the Trial Trenching, it cannot be definitively associated with the Grim's Ditch monument on this understanding alone.
- 9.1.8 If this is a continuation of Grim's Ditch, then it demonstrates varying levels of survival along the length of the monument, which was clearly maintained in some places but slighted in others. This stretch would have clearly varied in terms of formation and preservation to the extant Monument, that latter surviving in part due to being incorporated into woodland in the 1820s within a formalised garden.
- 9.1.9 Roman features, mostly ditches and pits, were present widely across the Site, the evidence seeming to suggest the presence of a minor rural farm or settlement with associated outlying enclosures and field systems. However few conclusions can be confidently drawn regarding the overall layout of the settlement, based on the evidence produced in the evaluation. The pottery assemblage suggests that the Site was established in the very Late Iron Age during the decades preceding the Roman invasion with several subsequent peaks and troughs of activity perhaps representing the waxing

and waning fortunes of the settlement throughout the Roman period. Activity appears to have virtually ceased by AD410.

- 9.1.10 The apparent sudden establishment of major activity within the Site at the beginning of the 1st century AD perhaps marks a general shift in landscape use, from a more open pastoral environment dominated by the large linear earthwork of Grim's Ditch to a more enclosed arable environment.
- 9.1.11 The pottery evidence seems to mark a positive shift in the fortunes of the settlement sometime in the mid-3rd century, with an increased number of fine ware fabrics being present, suggesting that the wealth and general prosperity of the settlement may have increased around this time.
- 9.1.12 Although a relatively modest assemblage of metal-working debris was recovered from the Site through hand retrieval and environmental sampling, it is nonetheless indicative that at least subsistence level metal working, both smelting and smithing, was taking place within the Site or nearby. Although there was no evidence of any in-situ industrial structures within the excavated Trenches, the presence of several complete or fragmentary hearth bases within feature fills, suggests that they must have been located in close proximity. The environmental evidence suggests a clear focus for this type of activity within the northern portion of the Northern Field and also suggests that animals may have been stabled in the same vicinity, indicated by the presence of burnt hay or bedding.
- 9.1.13 It is clear that the earthwork of the possible Grim's Ditch continuation or later addition to/re-modelling of, was extant well into the Roman period, the upper fills of which typically contained Roman material. It was an obvious and convenient place into which domestic and industrial waste could be discarded or would naturally accumulate, but it is not yet clear if the line of the ditch, if indeed it is Grim's Ditch, directly influenced the layout of any Roman features or boundaries.
- 9.1.14 No structures were identified during the trial trench evaluation, although the presence of Roman CBM in many features across the northern part of the Site, with a notable concentration in Trench o27 where a stone surface was identified, clearly suggests the presence of a tile-roofed building in the vicinity. Based on the CBM form, this roofed structure is believed to have been upstanding around mid-2nd – mid-3rd century, the latter part of which corresponds with the approximate time that the pottery suggests a general increase in the settlement's prosperity. This perhaps suggests that some re-modelling of the Site was undertaken around this time, to correspond with the increased wealth of the inhabitants.
- 9.1.15 There were few features dated to the post-Roman period, the pottery evidence demonstrating that the Site had fallen out of use by the end of the Roman period and had probably become part of the general agricultural hinterland of other nearby settlements. This is supported by the small assemblages of post-medieval CBM and buttons, coins and bells recovered from the topsoil. The possible exception is the pit seen in Trench o98 which may be part of a wider extraction activity such as can be seen in the historic area of Brick's Wood which was exploited for chalk. It is possible that the feature may be similar to the circular disturbances seen on the Monument and all could potentially be related to extraction of material such as flints, clay or chalk.

- 9.1.16 The test pitting contributed little to the overall understanding of the Site and similarly, the metal detecting contributed only limited results, with the vast majority of finds either undatable or of post-medieval/modern date.

KC2: Explore the location of Palaeolithic deposits, reconstruct past environments and investigate the relationship between climate variation and phases of human activity.

- 9.1.17 No palaeolithic deposits or finds were encountered on Site and no Trenches or features were of sufficient depth to reach the chalk geology underlying the clay-with-flints capping. Further investigation in the form of geoarchaeological test pits/Trenches would be required to investigate this objective effectively.
- 9.1.18 In regard to palaeolithic activity specifically related to solution holes (dolines) within the solid chalk geology, no Trenches were of sufficient depth to penetrate the chalk geology to identify or investigate any such doline features.

KC5: Identifying settlement location and developing models for settlement patterns of the Mesolithic, Neolithic and Early Bronze Age.

- 9.1.19 No Mesolithic, Neolithic or Early Bronze Age features or finds were present on the Site. However, flint flakes were present as residual deposition within a handful of features across the Site, attesting to activity in the area during these periods. These findspots could therefore contribute to developing models for settlement patterns as part of a wider study.

KC6: Understanding the evidence for change in the environment and management of the landscape for the Mesolithic and Early Neolithic periods.

- 9.1.20 As the only finds of Mesolithic and Early Neolithic date were residual struck flints within later features, there was no opportunity to examine any features or paleoenvironmental evidence associated with changes in land use during these periods.

KC13: What was the date of the establishment of Grim's Ditch? What impact did it have on the landscape following its construction?

- 9.1.21 The evaluation encountered a possible continuation of the Grim's Ditch monument, potentially including a break and a subsequently different segment from that currently extant. Further work is planned in order to examine the form and date of the surviving earthwork, but additional work is also required to better understand the possible continuation encountered within the Site.
- 9.1.22 Due to the limitations of the evaluation Trenches, where the ditch was encountered it was not possible to reach the base in any intervention as it lay beyond safe working depth. Full investigation would have required the stepping-out of the Trenches to enable safe excavation which was not possible due to the time constraints.
- 9.1.23 As the base of the ditch was not reached, this means that the full profile and depth could not be examined. Similarly, that potential dating and paleoenvironmental evidence from the basal fills could not be retrieved. For this reason, it was not possible to examine a full environmental sequence through the entirety of the ditch fills via snail column sampling,

which would have given detailed indication of the landscape in which the monument was first constructed and any subsequent shifts in landscape use over the following centuries.

- 9.1.24 Long linear earthworks of this nature are widely accepted to have been constructed in the Late Bronze Age to Early Iron Age but dating them precisely, even if pottery is recovered from the basal fill, may be problematic. Monuments of such scale would have required enormous effort to construct them and would very likely have seen episodes of maintenance in the following years. If such episodes cleaned the ditch back to its original edge and base, then any accumulated silting (and dating evidence it contained) would be removed, while there would be no evidence of this event visible in section. It is perfectly possible that this could have continued for a number of centuries after the construction of the monument. Therefore, at best, dating evidence recovered from the lower-most fills of such a ditch is only able to confidently date the time at which it was allowed to begin silting up and maintenance ceased. This may be quite some time after it was constructed.
- 9.1.25 The evaluation demonstrated that the ditch identified as a possible continuation of Grim's Ditch, contained Roman material within the upper fills. This indicates that the earthwork was still very notably extant in the Roman period and, in all likelihood, was used as a convenient place to dump domestic and industrial waste. That being so, it clearly disproves the notion that it may be of Saxon construction.
- 9.1.26 Within the excavated interventions there was no visible remnant of a bank on either side of the ditch or any buried soil horizon that might indicate a previous land surface, which would suggest that some minor truncation has occurred to the very upper part of the ditch, most likely through ploughing.

KC15: Can we identify regional patterns in the form and location of Late Bronze Age and Iron Age settlements across the route, and are there associated differences in landscape organisation and enclosure?

- 9.1.27 While no settlement dating to the Late Bronze Age period was identified within the Site, the tentative presence of a Middle Bronze Age pit and possible associated post hole structure, (located in Trench 135 Extension) was in close association with later Iron Age features, which could indicate some continuity in the landscape and re-use of locations.
- 9.1.28 The wider area was clearly utilised during the Middle to Late Iron Age, possibly in the hinterland of a settlement, as suggested by the presence of limited features and finds. The Site began to see extensive use in the very Late Iron Age/Early Roman transition period. This Site could contribute to a study of landscape organisation and enclosure during the Iron Age period. Further investigation of Grim's Ditch and the possible extension encountered within the Site could provide further evidence of landscape organisation in both these periods.

KC16: Investigate the degree of continuity that existed between Late Bronze Age and Iron Age communities in terms of population, mobility and subsistence strategies.

- 9.1.29 As described above, there was no evidence for Late Bronze Age settlement, only a suggestion of Middle Bronze Age, within the Site which would be able to contribute to wider study on the continuity (or not) of Late Bronze Age settlement transitioning into

the Iron Age. This means that it is not possible to directly compare environmental evidence for activities such as crop growing or processing. No burials were encountered to suggest the movement of people or ideas in these periods or lack thereof.

KC18: Explore the evidence for increasing social complexity in the archaeological record in the Late Bronze Age and Iron Age and identify patterns of intraregional and regional variation.

- 9.1.30 The Site has considerable potential to contribute towards this objective, most notably through the detailed study of the Grim's Ditch monument and the possible extension within the Site. This would enable a comparison with similar linear earthworks on a regional or national basis such as those in Wessex, which Cunliffe argues represent a major shift in land allocation (Cunliffe, 2004). It was argued by Tullet that such monuments, either intentionally or not, opened route ways through the landscape which facilitated shifts in agricultural practice and enabled wider-reaching contact and movement between communities. This may have led the communities to have a wider regional awareness and ultimate lead to the formation of tribal groups in the Later Iron Age (Tullet, 2010).
- 9.1.31 Detailed study of the monument would therefore contribute to this wider understanding of increasing social complexity, the construction of major monuments and how this might compare and contrast on a route-wide, regional or national basis.

9.2 Recommendations

- 9.2.1 In order to fully ascertain the nature, extent, date and development of the features identified in the trial trenching and their relationship to Grim's Ditch, targeted Archaeological Recording within the Site is recommended.
- 9.2.2 A possible continuation of the monument or another large ditch to the north-east was contained within the Northern Field. Targeted Archaeological Recording has the potential to confirm whether Grim's Ditch does indeed continue into the Site, or conversely to clarify the relationship may be between the monument and stretches of ditch identified in the evaluation. Crucially, by excavating a larger open area, it will enable the lower fills of these substantial ditches to be reached potentially leading to the recovery of dateable artefacts from the primary silting episodes and the recovery of palaeoenvironmental data. If the ditch(es) do prove to be a continuation of Grim's Ditch, environmental sampling through the entire sequence of ditch fills would provide crucial to a further understanding of the landscape within which the monument was constructed, maintained and eventually fell out of use. It would also assist in identifying if there was a shift of landscape use in the late Iron Age/early Roman period as suggested in Section 9.1 above. It may also assist in further refining the understanding of the date of such long linear earthworks and other major Prehistoric land divisions, contributing important information to the study of such monuments on a wider scale.
- 9.2.3 Even if the ditches prove not to be directly associated with the extant Grim's Ditch monument, then they are still substantial landscape features and need to be better understood. More fully investigating their origin in terms of date and environmental evidence is crucial to understanding the archaeological sequence within the Site and surrounding area.

- 9.2.4 Further work would also help define the extent of Roman activity identified within the northern part of the Site as well as more information on the date and development of features during this period. It would also potentially assist in identifying any in situ areas of metal-working or other industrial activities, which appear to have been occurring within the Site or nearby notably within the northern part of the Site. The focus of Roman activity seems to have generally been widespread within the northern half of the Northern Field. In the same vicinity are also numerous undated features which are not currently understood.
- 9.2.5 In the southern part of the Site, further consideration of the features here would also contribute to the wider archaeological picture, when considered in conjunction with any features identified within the adjacent parcel (Field H) and any further works.
- 9.2.6 All told, the evaluation has revealed widespread activity within the Site which is at present, poorly understood. While the focus of well-dated, mostly Roman, activity seems to be around the possible continuation of Grim's Ditch and within the Northern Field, the Southern Field should not be neglected in terms of Archaeological Recording strategy. Arguably, the lack of dating of many features here increases the need to better understand the phases of activity within this field through further mitigation. In order to fully investigate the archaeological remains of the Site, widespread Archaeological Recording targeting foci of features in both the Northern and Southern Fields is required. Without it, the features will only exist as disparate, undated and poorly understood pockets of activity.
- 9.2.7 For the targeted Archaeological Recording, formal confirmation will be agreed with the Employer, following stakeholder consultation, through a Decision Record Notice.

10 Consideration of Results in their Wider Context

- 10.1.1 The results of the Trial Trench Evaluation have made a significant contribution to understanding the archaeological context within which the Grim's Ditch Scheduled Monument is situated.
- 10.1.2 It has revealed a hitherto unidentified possible continuation of the monument to the north-east. If not a direct continuation of the ditch, it is at the very least a later substantial boundary which respected the alignment of the monument and/or re-established it as a major landscape feature in the Roman period. Should the ditch definitively prove to be a continuation of Grim's Ditch, the presence of Roman pottery within the upper fills would seem to firmly rebut the notion that the monument might be of Saxon date.
- 10.1.3 The paucity of Bronze Age remains and relatively limited number of Early or Middle Iron Age features unfortunately do not currently shed a great deal of light on the general landscape activity which may be contemporary. Further work may reveal additional features of these dates.
- 10.1.4 The evaluation also revealed extensive evidence for settlement during the majority of the Roman period, particularly focussed in the northern part of the Site. This included limited

evidence of metal working although no evidence of in-situ industrial structures nor any other vernacular structures, were identified. The pottery and CBM evidence suggested the settlement enjoyed a period of prosperity around the 3rd century AD. Understanding the fluctuating fortunes of the settlement, as well as locating any structural remains will be key in understanding its place within the wider landscape and economy in the Roman period. It may be possible to compare the Site alongside other Roman settlements along the route, identifying differences and similarities in form, function and changing fortunes.

11 Scheme Impacts

- 11.1.1 The scheme will impact on the Site through construction of the rail alignment formation which in this section will be in a cutting, as well as associated engineering works that include environmental bunds and tree-planting alongside the cutting, as well as land needed for temporary soil storage areas.

12 Evaluation of Methodology Used

12.1 Summary

- 12.1.1 The Trial Trench Evaluation has demonstrated archaeological activity across the Site and this information can be used to inform an appropriate mitigation strategy.

12.2 Strategy Appraisal

- 12.2.1 The Trial Trench Evaluation comprised 151 targeted Trenches across the Site of a planned 152. In the northern field 78 (of 79 planned) Trenches were 30 x 1.8m, eight were 50 x 1.8m and one was 80 x 1.8m. Within the Southern Field 64 Trenches were 30 x 1.8m and two additional areas 20m x 20m were opened up around Trenches 135 and 142. One Trench in the Northern Field, Trench 072, was not excavated due to access issues and the trench allocation was used in Field H.
- 12.2.2 A total of 453 test pits were excavated within the footprint of the evaluation Trenches to recover unstratified artefacts from the topsoil through sieving. These comprised three test pits per Trench. Three further test pits will be excavated within the footprint of Trench 072 when that Trench is excavated at a later date.
- 12.2.3 Trial Trench Evaluation was the most suitable investigation methodology in that it was possible to excavate the Trenches, and within the Trenches it was possible to investigate the exposed features. A sample of each feature was excavated as per the specifications of the Project Plan.
- 12.2.4 The Trench Extensions demonstrated that it is difficult to predict the presence and frequency of smaller features in larger areas.
- 12.2.5 The soil horizons throughout the stratigraphic sequence were clear and well-defined. The Trial Trench Evaluation confirmed the presence, absence, density, date and significance of the archaeological remains present and it is very unlikely that features were not identified within the Trenches. The trenching methodology is therefore judged to be a generally suitable method of evaluation in this landscape. The correlation with the

geophysical survey was limited with some anomalies corresponding with identified features and others not.

13 Statement of Archaeological Potential

- 13.1.1 The Site has high potential to contribute to multiple HERDS objectives through further examination of the archaeological remains encountered during the evaluation as discussed in Section 9 above.
- 13.1.2 At present there is only limited opportunity for the Site to contribute to objectives KC₂, 5 and 6 due to the absence of features dated to the Mesolithic and Early Neolithic, although further work may reveal as yet unencountered remains.
- 13.1.3 There is the clear potential for further and more detailed examination of Grim's Ditch and the possible extension encountered during the evaluation to provide direct and significant contribution to KC₁₃ as well as KC 15, a6 and 18.
- 13.1.4 In addition to the HERDS Objectives outlined the in the Project Plan, further work within the Site may also be able to contribute to the following objectives:
 - KC₂₁: Assess the evidence for regional and cultural distinctiveness along the length of the route in the Romano-British period, with particular regard to the different settlement types encountered along the route.*
 - KC₂₃: Identify evidence for late Roman occupation and attempt to identify any continuity in settlement patterns between the end of the Romano-British period and the Early Medieval period.*

14 Publication and Dissemination Proposals

- 14.1.1 Beyond the investigation of the Grim's Ditch monument and planned trial trenching within 'Field H', it is uncertain what further work may be undertaken on the Site. The results of the evaluation of the Site will be incorporated into the results of any further work and disseminated in accordance with the Employer policy as instructed.
- 14.1.2 A copy of the report will be provided to the Contractor in the first instance and then to the Employer for approval. The report will become a public document after a period not exceeding six months, a digital copy of the report will be deposited with the OASIS online archive and the Buckinghamshire Historic Environment Record. On completion of this project an appropriate short article summarising the work will be submitted to the Local Museum Services.

15 Archive Deposition

- 15.1.1 All retained finds will be treated and conserved in accordance with the English Heritage guidance document A Strategy for the Care and Investigation of Finds (English Heritage, 1995) and the UKIC's document Guidelines for the Preparation of Excavation Archives for Long Term Storage (UKIC, 1990). Should no further work be required, an ordered,

indexed, and internally consistent site archive, including digital formats (survey, photography etc) will be prepared and deposited in accordance with Archaeological Archives: A Guide to Best Practice in Creation, Compilation, Transfer and Curation (Archaeological Archives Forum 2007) and the HS2 documents: Technical Standard – Historic environment physical archive procedure (HS2-HS2-EV-STD-ooo-000039) and the Technical Standard – Historic environment digital data management and archiving procedure (HS2-HS2-EV-STD-ooo-00003), as well as guidance from ClfA (2014b) and SMA (1993). A summary of information from the project has been entered onto the OASIS online database of archaeological projects in Britain as per ADS guidelines (2015).

16 Acknowledgements

16.1.1 The Archaeological Contractor acknowledges the contributions made by all its staff and the help and advice provided by the Contractor's HERDS team, and the Employer for commissioning the project.

16.1.2 The following specialists also provided expert analysis and reporting on the finds and samples from the Site:

- Phil Mills (Pottery, CBM and Fired Clay)
- Val Fryer and Robert Fryer (Environmental samples)
- Richard Moore (Faunal remains)
- Rebecca Devaney (Flint)
- Adam Daubney (Metalwork)
- Lynne Keys (Slag)
- Raquel Margalef (Stone and Burnt Stone)

18 Glossary of Terms and Acronyms

The following terms have been used in this report:

Terms

Evaluation	A form of archaeological investigation involving the excavation of trenches to help determine the character and date of any discovered archaeology
The Contractor	The organisation undertaking the Enabling Works for Area Central on behalf of the Employer.
Generic Written Scheme of Investigation: Historic Environment Research and Delivery Strategy (GWSI: HERDS)	The framework for delivering all historic environment investigations undertaken as part of the HS2 Phase 1 programme.
The Employer	The organisation responsible for delivery of HS2 Phase One Scheme and all terms and conditions, policies, procedures, and payments
Location	A specific HS2 worksite or group of worksites that are being addressed as a combined historic environment investigation programme of assessment, evaluation and investigation.
Location Specific Written Scheme of Investigation (LSWSI)	Specification document assembling one or more Project Plans within an area of land defined primarily for construction programme purposes.
Project Plan	Specification document for each specific package of activity (e.g. a survey, desk-based assessment, excavation, recording project). The plans would respond to the Specific Objectives set out in the GWSI: HERDS and be delivered within an agreed budget.
Works	The specific historic environment assessment, evaluation or investigation works at each

Acronyms

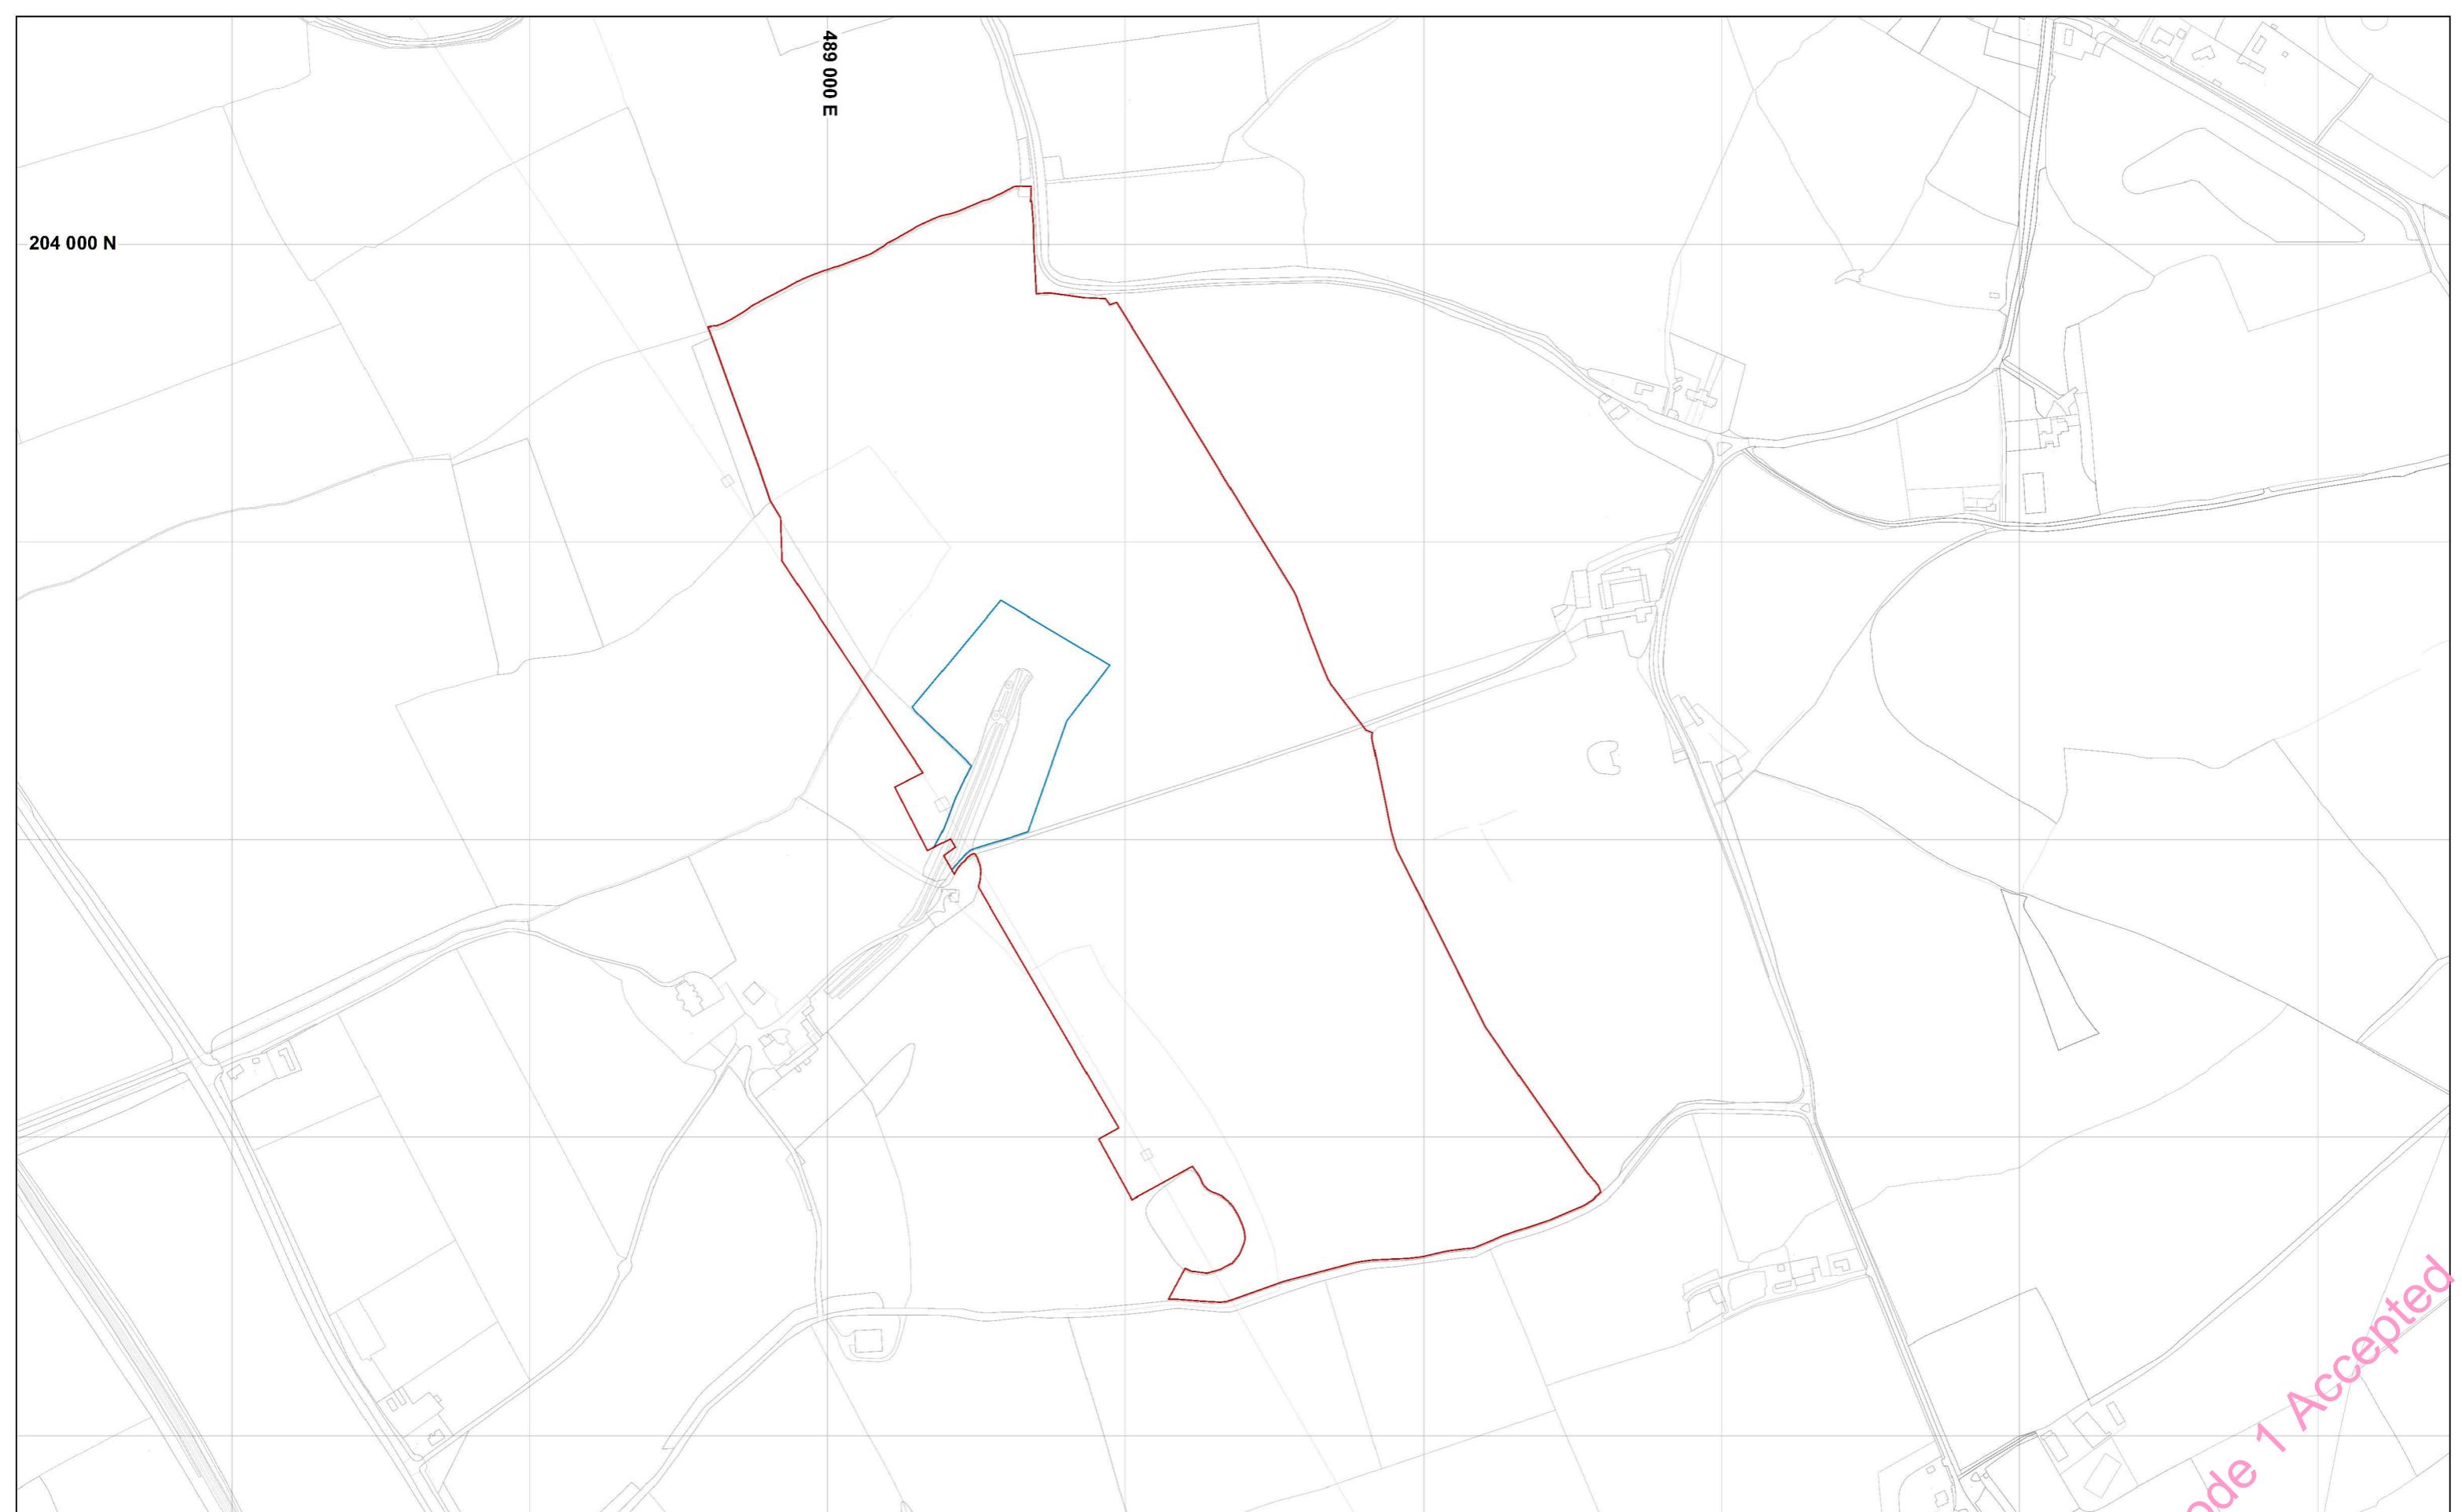

AAF	Archaeological Archives Forum
ACA	Archaeological Character Area

aOD	above Ordnance Datum
AD	Anno Domini
ANA	Archaeological Notification Area
ASZ	Archaeological Character Sub-Zone
BC	Before Christ
BHER	Buckinghamshire Historic Environment Record
CAT	Cable Avoidance Tool
CFA	Community Forum Area
CIaF	Chartered Institute of Archaeologists
CoCP	Code of Construction Practice
DMV	Deserted Medieval Village
EMR	Environmental Minimum Requirements
ES	Environmental Statement
GIS	Geographic Information Systems
GNSS	Global Navigation Satellite System
ha	Hectare
HE	Historic Environment
HER	Historic Environment Record
HERDS	Historic Environment Research and Delivery Strategy
ID	Identification
JV	Joint Venture
km	Kilometre

HS2 Ltd - Code 1 Accepted

LiDAR	Light Detection and Ranging
m	Metre
mm	Millimetre
MORPHE	Management of Research Projects in the Historic Environment
mya	Million Years Ago
NGR	National Grid Reference

Appendix 3 - Context Register

Table 2 Summary of contexts by Trench

Trench	Context No.	Type	Fill of:	Filled by:	Length (m)	Width (m)	Depth (m)	Description	Interpretation
1	900100	Layer			-	-	0.26	Dark grey brown friable clayey silt.	TOPSOIL
1	900101	Layer			-	-	-	Mid orange brown compact clay.	NATURAL
2	900200	Layer			-	-	0.27	Dark grey brown friable clayey silt.	TOPSOIL
2	900201	Layer			-	-	-	Mid orange brown compact clay.	NATURAL
2	900202	Deposit						Area of bioturbation. No sheet.	ROOTING
2	900203	Cut		900204	0.5	0.46	0.14	Oval. Concave, steep sides	NATURAL FEATURE
2	900204	Fill	900203		0.5	0.46	0.14	Dark brown grey friable silty clay, 25% charcoal, 5% stone	Fill of POSTHOLE
2	900205	Cut		900206	0.46+	0.85	0.36	Circular. Steep sides, concave base	PIT
2	900206	Fill	900205		0.46+	0.85	0.36	Mid brown slightly red friable to loose silty clay. Flint.	Fill of PIT
2	900207	Cut		900208	1+	0.57	0.39	Suboval. NW-SE. Steep uneven sides, undulating base.	DITCH
2	900208	Fill	900207		1+	0.57	0.39	Mid grey brown silty clay, mottled with light grey. Flint charcoal.	Fill of DITCH
2	900209	Fill	900210			0.38	0.19	Dark grey brown plastic silty clay, flint.	Fill of DITCH
2	900210	Cut		900209		0.38	0.19	Linear. NE-SW. Moderate sides, rounded base.	DITCH RECUT
3	900300	Layer					0.27	Dark grey silty clay, tacku	TOPSOIL
3	900301	Layer			-	-	-	Mid brown orange firm clay. flint.	NATURAL
4	900400	Layer					0.34	Dark grey brown friable clayey silt.	TOPSOIL
4	900401	Layer			-	-	-	Mid orange brown compact clay.	NATURAL
4	900402	Layer					0.16	Mid orange brown friable clayey silt.	SUBSOIL
4	900403	Deposit					0.07	Light brown grey clayey silt, friable. Stones.	ROOTING

HS2 Ltd - Code 1 Accepted

Trench	Context No.	Type	Fill of:	Filled by:	Length (m)	Width (m)	Depth (m)	Description	Interpretation
4	900404	Deposit					0.16	Light grey brown friable clayey silt. Stones.	ROOTING
4	900405	Cut		900406	0.75	0.44	0.35	Irregular. Steep sides, rounded base.	POSSIBLE PIT
4	900406	Fill	900405		0.75	0.44	0.35	Khaki friable loamy silt. Stones and flint	Fill of DITCH TERMINUS/PIT
4	900407	Cut		900408	1.69	0.61	0.36	Linear. N-S. Flat base. Steep sides	DITCH TERMINUS
4	900408	Fill	900407		1.69	0.61	0.36	Light yellow white silty clay, soft	Fill of DITCH TERMINUS
4	900409	Cut		900410	1.03	0.32	0.12	Linear terminus. W-E. Sloping sides, flat base	DITCH TERMINUS
4	900410	Fill	900409		1.03	0.32	0.12	Light yellow white silty clay, soft	Fill of DITCH TERMINUS
5	900500	Layer					0.21	Dark grey brown friable clayey silt.	TOPSOIL
5	900501	Layer			-	-	-	Mid brown orange silty clay, compact.	NATURAL
5	900502	Cut		900503	0.72	0.38	0.16	Subcircular. Steep to shallow.	NATURAL FEATURE
5	900503	Fill	900502		0.72	0.38	0.16	Grey sandy silt, charcoal. Compact.	Fill of NATURAL FEATURE
6	900600	Layer					0.19	Dark grey brown clayey silt. Stones	TOPSOIL
6	900601	Layer			-	-	-	Mid brown orange clay, compact. Flint.	NATURAL
6	900602	Deposit					0.14	Mid grey brown clayey silt, friable. Stones.	ROOTING
6	900603	Cut		900602	1.4	1	0.47	Circular. Steep concave sides and base.	POSSIBLE PIT
6	900604	Fill	900603		1.4	1	0.47	Mid grey, silty clay, firm. Flint.	Fill of PIT
6	900605	Cut		900606	1.7	0.9	0.46	Linear. Gradual sides, concave base.	DITCH
6	900606	Fill	900605		1.7	0.9	0.46	Mid yellow brown clayey silt, soft. Flint.	Fill of DITCH
7	900700	Layer					0.2	Dark grey brown friable clayey silt.	TOPSOIL
7	900701	Layer			-	-	-	Mid orange brown compact clay.	NATURAL
7	900702	Cut		900703-900710		5.66		Linear. E-W. Steep sides, base not reached.	BOUNDARY DITCH
7	900703	Fill	900702			2	0.24	Red brown silty clay, stones.	Fill of DITCH
7	900704	Fill	900702			4.72	0.3	Mid grey brown silty clay, chalk and flint.	Fill of DITCH

HS2 Ltd - Code 1 Accepted

Trench	Context No.	Type	Fill of:	Filled by:	Length (m)	Width (m)	Depth (m)	Description	Interpretation
7	900705	Fill	900702			3.06	0.22	Light brown silty clay. Stone and flint.	Fill of DITCH
7	900706	Fill	900702			5.04	0.28	Light to mid grey silty clay. Flint.	Fill of DITCH
7	900707	Fill	900702			3.54	0.14	Light orange brown silty clay. Flint.	Fill of DITCH
7	900708	Fill	900702			4.36	0.22	Mid brown to grey mottled silty clay. Flint, charcoal, stones.	Fill of DITCH
7	900709	Fill	900702			1.62	0.14	Black to dark brown silty clay, slag flint and charcoal. Burnt material.	Fill of DITCH
7	900710	Fill	900702			1.14	0.04	Black (burnt) to dark brown silty clay. Slag, flint, charcoal.	Fill of DITCH
7	900711	Cut		900712		0.18	0.2	Linear. E-W. Steep sides, flat base	DITCH
7	900712	Fill	900711			0.18	0.2	Light to mid brown silty loam. Small stones, flint.	Fill of DRAINAGE DITCH
7	900713	Fill	900702			5.56	0.16	Light to mid brown silty loam, stones and flint.	Fill of DITCH
8	900800	Layer			-	-	-	Dark grey brown friable clayey silt.	TOPSOIL
8	900801	Layer			-	-	-	Mid orange brown compact clay.	NATURAL
8	900802	Cut		900803	1+	1.1	0.37	Linear. SW-NE. Shallow sides, concave base	DITCH
8	900803	Fill	900802		1+	1.1	0.37	Mid grey brown firm clay. Flint, stone	Fill of DITCH
8	900804	Cut		900805, 900806	2+	6.85	0.25	Linear. N-S. Gradual to moderate sides, flat sloping base.	DITCH
8	900805	Fill	900804		2+	4.06	0.1	Mid red brown silty clay, friable. Magnesium, stones and flint.	Fill of DITCH
8	900806	Fill	900804		2+	6.85	0.2	Mid brown grey silty clay, friable. Charcoal, stone/flint.	Fill of DITCH
8	900807	Cut		900808	1+	0.7	0.08	Linear. NW-SE. Concave irregular profile.	HEDGEROW

HS2 Ltd - Code 1 Accepted

Project details

Project name	Evaluation at Hunts Green Farm (Grim's Ditch Environs), Buckinghamshire
Short description of the project	An archaeological Trial Trench Evaluation was undertaken at Hunts Green Farm (Grim's Ditch Environs), Buckinghamshire (C21023). The Site lies off Kings Lane, 2km due north of Great Missenden, Buckinghamshire. The main purpose of the Trial Trench Evaluation was to investigate potential archaeological remains associated within the Site. This included a possible extension of the Grim's Ditch Scheduled Monument. The trenches were targeted on geophysical, cropmark and LiDAR imagery and blank areas, and was designed to investigate areas of Construction impact. Of the 152 trenches proposed for excavation in the Project Plan, a total of 151 trenches were excavated. There were 89 trenches that revealed features of archaeological origin, although with varying quality of survival.
Project dates	Start: 19-10-2020 End: 03-12-2020
Previous/future work	Yes / Not known
Any associated project reference codes	1C19HGFTT - Sitecode
Type of project	Field evaluation
Site status	None
Current Land use	Cultivated Land 2 - Operations to a depth less than 0.25m
Methods & techniques	"Targeted Trenches"
Development type	Rail links/railway-related infrastructure (including Channel Tunnel)
Prompt	National Planning Policy Framework - NPPF

Position in the planning process Not known / Not recorded
