 Table 3. Sites investigated in the PASHCC project.

Aldingbourne RB

## MARINE PLEISTOCENE FORMAINIFERA

Species in bold italics - NOT part of the modern British fauna, but toda' with "southern" affinities

Species in plain italics - species restricted to southernmost Britain today, and further south

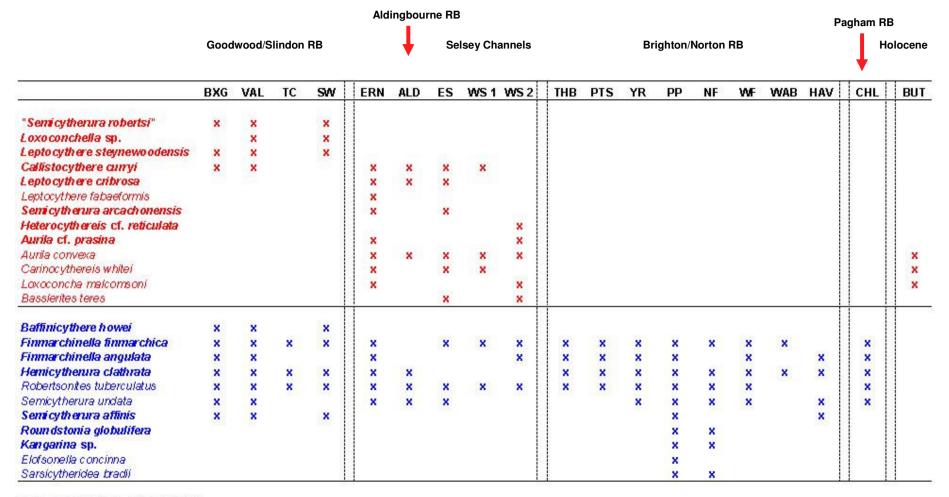

Species in **bold italics** - NOT part of the modern British fauna, but today live further north in Europe

Species in green - species at the limit of their range dwarfed by cold conditions

Species in purple - species revorked from older marine deposits (specimens broken and rolled)

Species in inverted commas (" ") remain to be formally described

**Table 5.** Key marker Foraminifera from selected sites investigated in the PASHCC project.

## MARINE PLEISTOCENE OSTRACODS

Species in **bold italics** - NOT part of the modern British fauna, but with "southern" affinities

Species in plain Italics - species restricted to southernmost Britain today, and further south

Species in bold italics - NOT part of the modern British fauna, but today live further north in Europe

Species in plain Italics - species restricted to northern Britain today, and further north

Species in inverted commas (" ") remain to be formally described

**Table 6.** Key marker Ostracoda from selected sites investigated in the PASHCC project.

**Table 9.** Age and stratigraphic models suggested for fluvial gravel aggradations in the Western Solent region. The discrepancy between the two stratigraphic schemes is due to the use of different gradients for projection along the Solent and position of stratotype locations at opposite ends of these.

| PASHCO<br>stratigra<br>age attri | phy and              | Westaway et al. (2006) stratigraphy                   | Assigned Marine Isotope<br>Stage or sub-Stage<br>(Westaway et al., 2006) |

**Table 10.** Comparison of the stratigraphy in the PASHCC Eastern Solent / Test Valley GIS with a previously suggested age model for the Eastern Solent / Test Valley from Westaway *et al.* (2006). Ages suggested in the PASHCC model are explained further in Table 4. It should be noted that the original British Geological Survey mapping does not suggest age attributions for this terrace sequence.

**Table 14.** Lithostratigraphic sites and finds summary from West Sussex Coastal Plain (West).

<sup>\*</sup> Rough pre-publication estimate provided for Boxgrove excavations — the precise figure for debitage is very dependent upon what size cut-off is taken. If one includes the myriad tiny chips and spalls, then the quantity is well into 5 figures

<sup>\*\*</sup> Totals exclude Boxgrove and Red Barns assemblages which result from extensive open area hand excavations, and therefore the quantities of figures are not comparable with the other material resulting from intermittent collection and chance finds

**Table 7.** OSL age estimates from the PASHCC study regions.

Shaded results those of dubious significance:

<sup>&</sup>lt;sup>1</sup>Sample nearing saturation – 200 ka is minimum age estimate only

<sup>&</sup>lt;sup>2</sup>Sample very close to surface in sandy deposit – assumed to have been reworked during the Late Devensian

<sup>&</sup>lt;sup>3</sup>Dates do not overlap and are close to limit of OSL dating, therefore it is difficult to tell which is more reliable

<sup>&</sup>lt;sup>4</sup>None of these dates are considered to be reliable because they are very scattered and are approaching saturation (see Briant et al., 2006)

<sup>&</sup>lt;sup>5</sup>BF03-02 and BF03-04 were rejected because they are approaching saturation and have associated large error bars (see Briant et al., 2006)

<sup>&</sup>lt;sup>6</sup>Dates do not overlap and are close to limit of OSL dating, therefore it is difficult to tell which is more reliable

<sup>&</sup>lt;sup>7</sup>Sediments are marine sands and cannot date to the middle of a cold stage at these elevations, also directly correlated with other sequences in the Brighton/Norton Raised Beach

<sup>&</sup>lt;sup>8</sup>Sediments and sequences directly comparable with Pagham sequences adjacent to site, too low an elevation for a date in MIS 7

<sup>&</sup>lt;sup>9</sup>Sediments are marine sands of Pagham Raised Beach and cannot be as young as 68ka in middle of cold stage

<sup>&</sup>lt;sup>10</sup>Seidments are cold climate solifluction deposits and are unlikely to form in middle of last interglacial
