A3.1:	Iron knives 2.13 and 2.28, from Danebury, used as prototypes for the experimental tools. 331		
A3.2:	Iron knives produced for the experiment.	331	
A3.3:	Flint tools being knapped by Linden Cooper.	332	
A3.4:	Three of the flint tools used in the experiment.	332	
A3.5:	Cut marks observed on the bones of the experimental pig heads.	333	
A3.6:	Splitting the skull with an iron knife and hammerstone.	333	
A3.7:	Disarticulating the mandible from the cranium using an iron knife.	334	
A3.8:	Marks made on the cranium of pig number 1 with a flint tool.	334	
A3.9:	Marks made on the mandible of pig number 1 with a flint tool.	335	
A3.10:	Marks made on the cranium of pig number 2 with an iron knife.	335	
A3.11:	Marks made on the mandible of pig number 2 with an iron knife.	336	
A3.12:	A split skull at Danebury from a late phase pit.	336	

### TABLES

### Chapter 2

2.1:	The dating at Danebury, as defined by Cunliffe 1995: 18.	51
2.2:	An example of the database entries for cattle bone, available for use in this study.	53
2.3:	Incidence of butchery marks on pig, cattle and sheep bone by Grant and Knight.	55
2.4:	Percentage of complete long bones by phase and feature type.	58
2.5:	Frequency of different bone elements identified as worked at Danebury.	60

### Chapter 3

3.1:	Coding for recording the position and purpose of butchery marks on pig bone.	66
3.2:	Pig butchery incidence by phase.	74
3.3:	Pig butchery: incidence of types of mark.	75
3.4:	Pig butchery in pits at Danebury by bone element.	76
3.5:	Pig butchery in layers at Danebury by bone element.	87
3.6:	Fusion status of butchered pig pelves (pits and layers).	96
3.7:	Age at death of pigs from pit deposits at Danebury.	97
3.8:	Age at death of pigs from layer deposits at Danebury.	98
3.9:	Cattle butchery incidence by phase.	104
3.10:	$\chi^2$ testing of similarity in cattle butchery incidence between phases and features.	104
3.11:	Cattle butchery at Danebury: incidence of types of mark.	105
3.12:	Cattle butchery in pits at Danebury by bone element.	106
3.13:	Cattle butchery in layers at Danebury by bone element.	116
3.14:	Incidence of butchered pig bone at Nettlebank Copse	125
3.15:	Butchery incidence on pig bone from Nettlebank Copse.	126
3.16:	Butchery incidence on cattle bone from Nettlebank Copse.	128
3.17:	Incidence of butchered pig bone at Suddern Farm.	130
3.18:	Incidence of butchered cattle bone at Suddern Farm	131
3.19:	Incidence of cuts to cattle bone at Suddern Farm from all Iron Age phases.	132
3.20:	Cattle butchery from early Iron Age Balksbury: pits.	137
3.21:	Pig butchery from middle-late Iron Age Balksbury: pits.	138
3.22:	Cattle butchery from middle-late Iron Age Balksbury: pits.	139
3.23:	Comparative chronologies for selected sites.	139
3.24:	Pig butchery from Nettlebank Copse and Suddern Farm: types of marks.	141
3.25:	Cattle butchery at Nettlebank Copse and Suddern Farm: types of marks.	142

### Chapter 5

5.1:	Categories of bone element determined from meat covering of bones.	209
5.2:	High, medium and low meat categorisation of bone from individual layers in pit 23	211
5.3:	Summary of (non-bone) finds and excavation information from pit 23	212
5.4:	Ages, in months, of the minimum numbers of individuals in pit 23, by layer.	214
5.5:	Numbers of bones per individual by pit layer.	215
5.6:	High, medium and low meat categorisation for late phase layers in grid D12	218
5.7:	High, medium and low meat categorisation for layers in pit 507	219
5.8:	High, medium and low meat categorisation for layers in pit 44.	223
5.9:	High, medium and low meat categorisation for early layers 41 and 45.	224
5.10:	High, medium and low meat categorisation for layers in pit 87, Suddern Farm	225
5.11:	High, medium and low meat categorisation for layers in pit 92, Suddern Farm	226

# Appendix 3

A3.1:	Mandibular Wear Stages of the two pigs used in the butchery experiment.	323
A3.2:	Meat and bone weights from the butchery experiment, to 5 grams.	328

### ACKNOWLEDGEMENTS

NERC provided funding for this research project. Without their financial assistance this thesis could not have been produced, so I would like to take this opportunity to gratefully recognise their contribution.

Many thanks are due to the staff at the School of Archaeology and Ancient History for their continued support, especially Dr Annie Grant, my supervisor, whose practical and levelheaded advice (and her time) was invaluable. Annie also made available her database and butchery archive material. I would also like to thank Dr Mark Gillings who was always willing to help with technical matters, discuss ideas and read through drafts, and also Dr Jeremy Taylor for comments on previous drafts and providing friendly advice. Professor Graham Shipley gladly assisted with the Greek and Latin translations, and Tony Gouldwell was happy to help with methodological and identification matters, and provided technical support during the preparation of the bones from the experiment. Alex Mosely also deserves a mention, for never being too busy to help with computer problems, and Deirdre O'Sullivan, for providing encouragement (and accommodation) in the final stages.

Collecting primary data was made very much easier and more enjoyable by the helpful and enthusiastic people I continually besieged for information. Professor Barry Cunliffe permitted access to the records and use of some diagrams for publications, and referred me to Dr Richard Osgood, who provided updated records of pit reliability and phasing, and enabled me to briefly join in the excavation of a Danebury Environs site at Grately. Also, I would like to express my appreciation to Kay Ainsworth, for access to the Danebury archive in Winchester; Dr Gary Lock for information on the computerised Danebury records, and the experience of digging at Alfred's castle; and Dr Mark Maltby for the explanation and use of his recording conventions for Balksbury butchery marks.

Julie Hamilton freely provided access to her records of butchery from the Danebury Environs sites, in addition to cups of tea and many e-mailed files; Dr Jaco Weinstock located and made available the relevant paper archive at the Southampton Faunal Remains Unit; Laura Pugsley took the time to discuss her experience of pig butchery; Rachael Pope permitted my use of her draft paper on Iron Age cooking methods; and Joan Segui provided a home video of traditional Catalan pig slaughter. Staff at the Hampshire County Council sites and monuments records office cheerfully took the time to check whether any finds from field walking had been recovered in the vicinity of the hillfort.

For help with the butchery experiment, many people are due thanks. Dr Peter Crew, in conjunction with Hector Cole the blacksmith, produced iron knives for our use, modelled to our specifications. Linden Cooper and Jodie Humphrey knapped flint tools, and Jodie deserves special mention for the use of her kitchen to boil the pig heads. For his enthusiasm and willingness to assist and demonstrate techniques (despite bad health) Richard Wood has been invaluable. Andrew Worden, whose patience after two false starts with the experiment was never rewarded, since his herd of boar finally succumbed to foot and mouth, and Robert Boulton, who showed me how to spit roast a pig, also have my gratitude.

Dr Alan Outram and all at the University of Exeter Archaeology Department helped immeasurably through their optimism and entreaties to 'get it done'. Thanks also to all the postgraduates at Leicester, whose company, advice and tolerance I greatly appreciate!

Family and friends (you know who you are), thanks for your support and understanding. Special thanks go to Cain Hegarty, who transformed many of my drawings into computer images worthy of inclusion, for his patience and quiet encouragement.
