

Photo No.4 Trench 2 machined. No quarry pit was identified here, only this shallow silt deposit with well sorted stone fragments, more characteristic of a water-born deposit than the backfill of a quarry pit. Looking west-southwest.

Photo No.5 Sample section recorded in Trench 2. Note the outcropping nature of the weathered limestone, similar to Trench 1; the silt deposit seems to in-fill around the stone, rather than in-filling a defined 'man-made' cut. Scale: 1m. Looking north-northwest.
