

## Appendix 3

# Roxby Gullet Rising Main, North Lincolnshire ROXG 06 Lithic Materials: Catalogue

Report by Jim Rylatt – October 2006

## 1.0 Catalogue

One piece of worked flint was recovered:

Context	Type	Reduction sequence	Date	Weight (g)	Size (mm)	Recorticated	Burnt
001	Bladelet	tertiary	L.Mes/ E.Neo		47x33	no	no
Retouch	Platform	Bulb	Termination	Post-dep damage	Comments		
no	abraded	very small pronounced	feathered	yes	Small bladelet with dorsal scars indicating removal from bladelet core, possibly type A, with platform edge preparation; possible retouch along distal margin, but more likely to be post-depositional damage, latter probably accounts for more irregular chipping along lateral margins; brownish-grey translucent flint		

## 2.0 Comments

A small bladelet that is a typical product of late Mesolithic to early Neolithic industries. The modification to the flake margins is unsystematic and probably results from rolling or bioturbation within the topsoil/ploughsoil.
