

**Plate 4 (right):** The excavated pipe-trench running across the corner of the field, looking west. The low sunlight makes the trench sections difficult to see, but the colour variations on the adjacent spoilheap show the changes from limestone brash to solution material.

**Plate 5 (left):** Sample section A-B, looking south-east, showing the depth of topsoil adjacent to the north-western field edge.

**Plate 6 (right):** Sample section C-D, looking south. Light conditions were extremely adverse, but the change in topsoil depth can be made out; a small solution feature is visible to bottom left.
