SUMMARY

Project Name: Land West of Heather

Location: Heather, Leicestershire

NGR: SK 3862 1094

Type: Fieldwalking & Evaluation

Date: 19 to 21 September 2016 (fieldwalking)

27 September to 7 October 2016 (evaluation)

Location of Archive: To be deposited with Leicestershire Museum Services

Site Code: LWH 16

Between September and October 2016, Cotswold Archaeology (CA) carried out a programme of fieldwalking followed by a sixty-three trench evaluation at land west of Heather, Leicestershire. The fieldwork was undertaken to inform a planning application for the residential development of the site.

A previous geophysical survey identified a number of anomalies, considered likely to be agricultural in origin.

Archaeological material recovered during the fieldwalking was predominantly of postmedieval date. The material was fairly well distributed across the site and no particular concentrations were revealed, accordingly little meaningful interpretation can be made.

The evaluation identified a number of ditches containing modern inclusions within their fills. These broadly correspond within the general alignment of the surrounding field systems as depicted on historic and current Ordnance Survey mapping and are considered to be representative of agricultural activity.

The evaluation also recorded a number of furrows indicative of medieval/post-medieval agricultural activity. However, none of the furrows produced any dating evidence and no other evidence for medieval activity was recorded.

A large pit, corresponding to a pond depicted on historic mapping was identified in the western part of the site, with undated ditches and pits identified within the northern part of the site.

1. INTRODUCTION

- 1.1 In September 2016, Cotswold Archaeology (CA) carried out archaeological fieldwalking and an evaluation at Land west of Heather, Leicestershire (centred on NGR: SK 3862 1094; Fig. 1). The evaluation was commissioned by Rosconn Limited.
- 1.2 The fieldwalking and evaluation was undertaken to inform a planning application to North West Leicestershire District Council (NWLDC; the local planning authority) for the residential development of the site. In her pre-application advice regarding the site, Sophie Clarke, Planning Archaeologist, Leicestershire County Council (PALCC), the archaeological advisor to NWLDC recommended a programme of archaeological works to include fieldwalking and trial trenching.
- 1.3 The scope of the fieldwalking, which comprised a systematic grid with 10m transects, was defined during discussions between CA and Sophie Clarke. Subsequently, the scope of the evaluation, which comprised the excavation of 63 trenches, was informed by the fieldwalking and defined during discussions between CA and Sophie Clarke. Theses discussion were also informed by a heritage statement prepared by CA (2016a) and a geophysical survey prepared by Magnitude Surveys (MS 2016).
- 1.4 The fieldwork was carried out in accordance with a *Written Scheme of Investigation* (WSI) produced by CA (2016b) and approved by Sophie Clarke. The fieldwork also followed *Standard and guidance: Archaeological field evaluation* (ClfA 2014), the *Management of Archaeological Projects* 2 (English Heritage 1991) and the *Management of Research Projects in the Historic Environment (MORPHE): Project Manager's Guide* (HE 2016). It was monitored by Sophie Clarke, including a site visit on the 3 October.

The site

1.5 The proposed development area is approximately 7ha in size, and comprises three arable fields on the western edge of the village of Heather (Figs 1 to 3). The site is bounded by Swepstone Road to the south, Normanton Lane to north-east and residential development to the east. It is bounded to the north and west by an area

of wooded plantation or scrubland. The site lies at approximately 135m above Ordnance Datum (aOD), dropping down in the western extent of the site.

1.6 The underlying solid geology of the site is mapped as Tarporley Siltstone of the Triassic Period, overlain by superficial Quaternary glacio-fluvial deposits of sand and gravel (BGS 2016).

2. ARCHAEOLOGICAL BACKGROUND

Prehistoric (pre-AD 43) and Roman (AD43 – AD 410)

Early Prehistoric

2.1 There are no prehistoric heritage assets recorded within the site. Fieldwalking undertaken in 1990, 1km to the north of the site, recorded a number of stone tools including scrapers, blades and blade cores. These are thought to date from the early Mesolithic to the late Bronze Age. Approximately 1km to the south of the site a large flint scatter consisting of blade cores, rejuvenation flakes, blades, flakes and retouch pieces was identified during a programme of field walking undertaken in 1982. These finds have been suggested to represent the remains of Mesolithic occupation and are likely to relate to temporary areas of settlement, which made use of the fertile soils of the valley of the River Sence.

Later Prehistoric and Romano-British

- 2.2 Geophysical survey has identified a curvilinear anomaly in the south-western part of the site (MS 2016). Cropmarks in the field immediately to the west of the site, consisting of a 70m by 70m square enclosure and a number of linear cropmarks are thought likely to be on Iron Age date. These cropmarks have been interpreted as representative of Iron Age agricultural activity, with possible stock enclosures and the linear features indicative of field systems.
- 2.3 A Roman coin found to the north of the site indicates a Roman presence within the landscape surrounding the site. An Iron Age and Romano-British enclosure system is recorded approximately 500m to the north. It was initially identified by aerial photograph evidence and was subsequently investigated by geophysical survey, trial trenching and excavation, revealing evidence for later prehistoric and Romano-British activity.

- A series of cropmarks, consisting of rectangular enclosures with associated double ditched linear features have been identified from aerial photographic evidence recorded over 1km to the north of the site. Fieldwalking was undertaken in the region surrounding the cropmarks and finds of Late Neolithic and Early Bronze Age date were recovered. Intrusive investigation comprising trial trenching of the cropmarks focussed on the double-ditched linear features visible on the aerial photographs. The trial trenching also identified a feature thought to be the remains of a palisade in the northern most extent of the area (Thorpe et al 1994). A subsequent phase of excavation indicated that the cropmarks represented initial Iron Age occupation with continuity into the Romano-British period.
- 2.5 An extensive area of cropmarks is visible on historic aerial photographs approximately 300m to the south of the site. These cropmarks comprise features which are thought to be indicative of possible trackways and enclosures as well as ring ditches and may represent the remains of a Bronze Age or Iron Age settlement. A further expanse of cropmarks is visible on historic aerial photographs approximately 600m to the west of the site. These cropmarks consist of a series of curvilinear and linear features and some possible square enclosures, interpreted as evidence for Iron Age/Romano British settlement.
- 2.6 The Leicestershire Historic Environment Record (LHER) records a number of other heritage assets of prehistoric to Roman date in the vicinity of the site. A programme of fieldwalking undertaken approximately 1km to the south-west of the site in 1980, recovered Roman pottery, ceramic building material and tesserae, as well as six sherds of Late Iron Age pottery. Further fieldwalking *c*. 1km to the north-west, revealed evidence for Roman activity based on finds of Roman pottery, two brooches, a coin of Nero, a steelyard weight, jewellery, votive cockerels and a spoon handle.
- 2.7 The conjectural alignment of the Roman road of 'Via Devana' is suggested to run from the north-west to the south-east, *c*. 1km to the north of the site.

Early medieval (AD 410 – AD 1066) and medieval (AD 1066 – 1539)

2.8 An Anglo-Saxon die is recorded as a find spot a couple fields to the north of the site.

The settlement of Heather is recorded by the Domesday Book and was part of the Hundred of Guthlaxton. The settlement at this time was a 'very small' settlement,

comprising four households with four villagers, two ploughlands and one men's plough team and was accountable to the Lord Esbiorn of Oadby in 1066.

- 2.9 The LHER records the find spot of a medieval spindle whorl within the site. The LHER also records the alignments of extensive areas of ridge and furrow cultivation in the vicinity of the site. Former ridge and furrow cultivation, aligned broadly north to south, is recorded in the southernmost field of the site, but the geophysical survey did not produce any anomalies indicative of ridge and furrow.
- 2.10 The wider landscape surrounding the site appears to have been a predominantly rural landscape formed by the agricultural hinterlands of the parishes and medieval settlements of Heather, Swepstone and Normanton-le-Heath. There is further evidence of medieval agricultural activity in the wider landscape with the location of two fishponds on the southern outskirts of Swepstone village.

Post-medieval (1540 – 1800) and modern (1801 – present)

- 2.11 The Tithe Map of the Parish of Heather dating to 1847 indicates that the site has undergone little alteration since the mid-19th century and that during the post-medieval period the site remained part of the agricultural hinterland of the village.
- 2.12 A large area of industrial and quarrying activity is located approximately 800m to the east of the site. This area is centred along the route of the Ashby and Nuneaton Railway, which had a railway station in Ibstock, open between 1873 and 1964. This area of industry comprised Heather opencast colliery site, three brick and terracotta works, a clay pit and a quarry.

3. AIMS AND OBJECTIVES

3.1 The objectives of the fieldwalking and evaluation, as detailed in the WSI (CA 2016b), were to provide information about the archaeological resource within the site, including its presence/absence, character, extent, date, integrity, state of preservation and quality. In accordance with Standard and guidance: Archaeological field evaluation (CIfA 2014), the evaluation was designed to be minimally intrusive and minimally destructive to archaeological remains. The information gathered will enable NWLDC, to identify and assess the particular significance of any heritage asset, consider the impact of the proposed development upon it, and to avoid or

minimise conflict between the heritage asset's conservation and any aspect of the development proposal, in line with the National Planning Policy Framework (DCLG 2012).

3.2 During the course of the fieldwork the results were assessed and, where relevant, reference was made to the regional research objectives outlined in 'East Midlands Heritage: A research Agenda and Strategy for the Historic Environment' (Knight et al. 2012) and the earlier research agenda for the East Midlands 'The Archaeology of the East Midlands: An Archaeological Resource Assessment and Research Agenda' (Cooper 2006) so that a project-specific research agenda could be implemented.

4. METHODOLOGY

Fieldwalking

- The fieldwalking survey took place across the entire site (7ha; Fig. 4). The site had recently been ploughed and reported as being suitable for survey. The fields within the site were numbered and a series of transects established within the individual fields using a Leica GPS. Transects were marked out, in accordance with *CA Technical Manual 4: Survey Manual* (2012). Transects were aligned parallel to the longest boundary of the individual field being surveyed and spaced at 10m intervals and tied in to the OS grid and assigned alphanumeric identifiers (e.g. Transect 1A, Transect 1B, etc., in Field 1; Transect 2A, Transect 2B, etc., in Field 2; etc.).
- 4.2 The fieldwalking team walked each transect, and observed 2m-wide corridors centred on each individual transect as a basis for artefact collection.
- 4.3 The length of each transect were subdivided into a series of 10m stints. Artefacts recovered from each individual stint were bagged together, marked with the CA site code (LWH 16), the field number, alphanumeric transect number, and stint (e.g. SITE CODE, Field 1, Transect 1A, 0–20m). With the exception of modern material (19th-century or later) and animal bone, all artefacts were collected. Record sheets were completed for each field, detailing land use, ground conditions, visibility, and fieldwalking personnel.

Evaluation

- 4.4 The evaluation comprised the excavation of sixty-three trenches in the locations shown on the attached plan (Fig. 5). All trenches were 30m long and 1.8m wide. The targeted trench plan was designed to sample the potential archaeological features identified by the geophysical survey (MS 2016) as well as to test the area of finds concentrations identified by fieldwalking and to investigate apparently archaeologically blank areas. Trenches were set out on OS National Grid (NGR) coordinates using Leica GPS and surveyed in accordance with *CA Technical Manual 4: Survey Manual*. Trenches were scanned for live services by trained Cotswold Archaeology staff using CAT and Genny equipment in accordance with the Cotswold Archaeology *Safe System of Work for avoiding underground services*.
- 4.5 All trenches were excavated by a mechanical excavator equipped with a toothless grading bucket. All machine excavation was undertaken under constant archaeological supervision to the top of the first significant archaeological horizon or the natural substrate, whichever was encountered first. Where archaeological deposits were encountered they were excavated by hand in accordance with CA Technical Manual 1: Fieldwork Recording Manual.
- 4.6 Deposits were assessed for their palaeoenvironmental potential in accordance with CA Technical Manual 2: The Taking and Processing of Environmental and Other Samples from Archaeological Sites and were sampled. All artefacts recovered were processed in accordance with CA Technical Manual 3 Treatment of Finds Immediately after Excavation.
- 4.7 The archive and artefacts from the evaluation are currently held by CA at their offices in Milton Keynes. Subject to the agreement of the legal landowner the artefacts will be deposited with Leicestershire Museums Service, along with the site archive. A summary of information from this project, set out within Appendix C, will be entered onto the OASIS online database of archaeological projects in Britain.

5. RESULTS (FIGS 4-8)

Fieldwalking and Evaluation

5.1 This section provides an overview of the fieldwalking and evaluation results; detailed summaries of the recorded contexts are to be found in Appendix A; summaries of the recorded finds are to be found in Appendix B.

Fieldwalking

5.2 The fieldwalking produced a small assemblage of material comprising 63 sherds of pottery, 80 fragments of ceramic building material (CBM), three pieces of worked flint and a single piece of metalwork. Notably, 58 of the 63 sherds of pottery were post-medieval and 70 of the 80 fragments of CBM were post-medieval. The distribution of material recovered during fieldwalking is show on Fig. 4. The material was fairly well distributed across the site and no particular concentrations were identified.

Evaluation

- A similar stratigraphic sequence was identified within each of the trenches. The natural geological substrate, which comprised sands and gravels, was revealed at an average depth of between 0.36m and 0.67m below present ground level (bpgl). In twenty-six trenches the natural geology was overlain by subsoil or colluvium, comprising silty sand between 0.1m to 0.72m m thick. This was in turn overlain by plough soil. In the remaining thirty-seven trenches the natural geology was directly overlain by a layer of friable plough soil averaging 0.25m to 0.60m in thickness.
- In total fifty-four of the sixty-three trenches were blank and no archaeological features or deposits were identified within Trenches 1 to 17, 19, 22 to 30, 33 to 48, 51 to 60, 62 and 63.

Trench 18 (Fig 5)

5.5 Pit 1803 was partially revealed at the western end of Trench 18. It was excavated to a depth of 1.1m without the base being reached. Modern brick and construction rubble were observed within its dark brown grey clay silt fill (1804). It appears to broadly correspond with a discrete anomaly identified by the geophysical survey and corresponded with a pond first depicted on the 1883 First Edition Ordnance Survey Map.

Trench 31 and 32 (Figs 5 & 6)

East/west orientated ditch (3103) was revealed towards the south-western end of Trench 31 (Fig. 6; section AA). It measured 1.09m wide by 0.27m deep, with moderately curved sides and flat base. No finds were recovered from its brown grey sandy silt fill (3104). Ditch 3203, recorded on the same east/west orientation towards the southern end of Trench 32, was considered likely to represent the continuation of the ditch 3103, excavated in Trench 31. Both ditches broadly correspond with an anomaly identified on the geophysical survey.

Trench 49 (Fig 5)

5.7 North/south orientated ditch 4903 was located towards the north-eastern end of Trench 49. It measured 2m wide by 0.1m deep and its profile was near imperceptible due to its shallow nature and flat base. It contained a dark grey brown compact sandy silt fill (4904), which contained fragments of modern brick.

Trench 50 (Figs 5 & 7)

5.8 East/west orientated ditch 5002 was revealed towards the centre of Trench 50 (Fig. 7; section BB). It measured 0.7m wide by 0.11m deep, with shallow curved sides and a broadly flat base. The geophysical survey had not revealed any corresponding evidence for the ditch.

Trench 61 (Figs 5 & 8)

- North/south orientated ditch 6103 was revealed towards the north-western end of Trench 61 (Fig. 8; section CC). It measured 1.1m wide by 0.25m deep with moderately sloping sides and an irregular base. Although the ditch had not been identified by the geophysical survey it ran broadly parallel to linear anomalies which had been identified by the geophysical survey within this area (MS 2016).
- 5.10 Postholes 6105 and 6107 were located towards the centre of Trench 61 (Fig. 8; sections DD & EE). They measured 0.45m in diameter by 0.28m and 0.14m deep respectively. Both had relatively steep slightly curved sides with flat bases. The postholes were isolated and no similar features were recorded in the surrounding trenches. The geophysical survey had not revealed any corresponding evidence. Accordingly it is considered unlikely that the postholes represent the remains of a structure.

5.11 North/south orientated ditch 6109 was revealed within the south-eastern half of Trench 61 (Fig. 8). It measured 2m wide and was excavated to a depth of 0.4m. It contained fragments of modern brick rubble within its silty sand fill (6110). Similar to 6103 it ran broadly parallel to linear anomalies identified by the geophysical survey within this area (MS 2016).

Furrows

Trench 20 & 21 (Fig 5)

North-east/south-west orientated furrows 2002 and 2004 were recorded in Trench 20. Two furrows 2102 and 2004 were revealed in Trench 21. It is considered likely that furrow 2104 represents the continuation of furrow 2002. A section was excavated through furrow 2102, which measured 1m wide by 0.1m deep. It had shallow curved sides and a relatively flat base. Although more possible furrows were identified by the geophysical survey there was no corresponding evidence revealed during the trial trenching and no more furrows were observed in plan or section.

6. THE FINDS

A small assemblage, comprising 63 sherds of pottery, 80 fragments of ceramic building material, three pieces of worked flint and a single fragment of probably modern metalwork was recovered during fieldwalking at land west of Heather, Leicestershire. All of the material was recovered from topsoil and was in poor condition. A table of the recorded finds is to be found in Appendix B.

Pottery

6.2 The pottery assemblage consists of a single sherd of Roman material, four sherds of medieval material and 58 sherds of post-medieval material. All of the sherds were small and heavily abraded, and all were residual in the modern ploughsoil. None of the material could be dated other than to broad period.

Lithics

6.3 Three worked or probably worked flint items were recovered. A fourth piece (stint C2D) appeared not to be worked and has been discarded. As is typically the case for surface collected material the recovered pieces exhibit very heavy edge damage and rolling (abrasion). Raw material consists of dark grey and mid grey-brown flint.

All pieces retain areas of cortex, which is in all instances thinned/abraded and suggestive of derivation from secondary (gravels) sources.

None of the recovered pieces are individually dateable. The single flake (stint A5C) is blade-like in its proportions, but thick, and unlikely to have been intentionally produced as a blade. Possible cores were recorded from stints C3P and C6B. Both consist of irregular pieces from which one (C3P) or two (C6B) flake-like removals have been struck. The damage is however so severe that it is unclear whether the removals are the result of deliberate human action, or of accidental plough damage.

Ceramic Building Material (CBM)

The ceramic building material comprises one fragment of medieval material, nine fragments of undated material and 70 fragments of post-medieval/modern material.

All of the material was heavily abraded and not identifiable other than to broad period.

Other finds

6.6 A section from a tubular object made from rolled and butted iron sheet was recorded (stint B1L). It is almost certainly of modern date and will not be retained.

7. DISCUSSION

- 7.1 Archaeological material recovered during the fieldwalking was predominantly of post-medieval date. Whilst three flint cores were recovered these could not be individually dated and there were no artefacts definitively dated to the prehistoric period. There was little material dated to the Roman or medieval periods. In total five of the sixty-three sherds of pottery pre-dated the post-medieval period comprising a single sherd of Roman pottery and four sherds of medieval pottery. Fifty-eight of the sixty-three sherds of pottery were post-medieval and seventy of the eighty fragments of CBM were post-medieval. The distribution of material recovered during fieldwalking is show on Fig.4. The material was fairly well distributed across the site and no particular concentrations were identified. All of the pre post-medieval material was considered likely to be residual and the result of agricultural activity such as manuring.
- 7.2 The evaluation recorded a number of furrows indicative of medieval/post-medieval agricultural activity. However, none of the furrows produced any dating evidence and no other evidence for medieval activity was recorded. No further evidence for any pre post-medieval activity recorded during the evaluation.
- 7.3 Ditches 4903 and 6109 were dated to the modern period by finds of modern inclusions such as brick within the fills. It is considered likely that these features represent agricultural activity.
- 7.4 A large pit (1803), corresponding to a pond first depicted on the 1883 First Edition Ordnance Survey Map and last seen on the 1966 Ordnance Survey Map, was identified in the western part of the site.
- 7.5 Despite the evidence for prehistoric and Roman activity identified from cropmark evidence 300m to the south and 600m to the west of the site no similar evidence was revealed within the site by the fieldwalking or evaluation. There was limited correlation between the anomalies identified by the geophysical survey and the features recorded during the evaluation (MS 2016).
- 7.6 A total of four undated ditches (3103, 3203, 6103 and 6109) and two undated pits (6105 and 6107) were identified within the site, which could not be attributed to any other identified periods of activity. However, it is probable that these features were

contemporary with either the identified post-medieval/modern activity or the Iron Age field systems recorded to the west.

8. CA PROJECT TEAM

Fieldwork was undertaken by Andrew Whelan, assisted by Anna Moosbauer, and Rebecca Pritchard. The report was written by Andrew Whelan. The finds and biological evidence reports were written by Dan Stansbie. The illustrations were prepared by Lesley Davidson. The archive has been compiled by Emily Evans, and prepared for deposition by Hazel O'Neill. The project was managed for CA by Stuart Joyce.
