SUMMARY

Project Name:	South West Aylesbury
Location:	South West Aylesbury, Buckinghamshire
NGR:	481072 211596
Type:	Evaluation
Date:	Phase 1: 5 March - 13 April 2018 & Phase 2: 8 - 18 May 2018
Location of Archive:	To be deposited with Buckinghamshire County Museum
Site Code:	ASUE18

An archaeological evaluation was undertaken by Cotswold Archaeology in two phases between March and May 2018 on land south-west of Aylesbury. One hundred and four trenches were excavated during the first phase and a further thirty eight trenches in phase two. Widespread flooding during the first phase of works limited the numbers of archaeological features that could be hand excavated but despite the adverse weather conditions three main centres of archaeological activity were identified and characterised in addition to a number of outlying features, chiefly boundary/enclosure ditches.

Areas 5/6; a large number of rectilinear enclosure ditches, which appear to match the geophysical survey, demonstrate Romano-British occupation activity. Extant medieval ridge and furrow cultivation overlies part of this activity with the earlier ditches visibly surviving beneath the ridge and furrow system.

Area 7; the archaeological activity is focused on a low mound/hill within the centre of the flood plain. A number of late prehistoric/Romano-British ditches enclose two west-east orientated inhumation burials and a number of discrete features cut into the brickearth, indicating the presence of an enclosed farmstead/small settlement site.

Areas 10/11 are dominated by a large concentration of late prehistoric and Romano-British ditches and occupation soils in addition to material evidence demonstrating the presence of a significant Roman building being within the immediate area. A third inhumation burial was also recorded demonstrating the presence of a third settlement site within the survey area.

1. INTRODUCTION

- 1.1 In March and April 2018 Cotswold Archaeology (CA) carried out the first phase of an archaeological evaluation for CgMs Consulting acting on behalf of Gleeson Strategic Land at South West Aylesbury (centred at NGR: 481072 211596; see Figure 1); the second phase located in the eastern extent of the proposed urban extension was undertaken in May 2018. The two phase approach was undertaken as a result of the waterlogged conditions experienced in the western half of the footprint. The trial trenching was undertaken to evaluate the archaeological potential of the site to accompany a future planning application to Aylesbury Vale District Council.
- 1.2 The evaluation was carried out in accordance with a detailed *Written Scheme of Investigation* (WSI) produced by CA (2018) and approved by Eliza Alqassar. The fieldwork also followed *Standard and guidance: Archaeological field evaluation* (ClfA 2014). It was monitored by Eliza Alqassar and Philip Markham including site visits on 7th, 14th & 27th March and the 16th May 2018.

The site

- 1.3 The proposed development area is approximately 107ha, and comprises nineteen parcels of land to the south of Oxford Road (A418) and forming a 3km band along the western outskirts of Aylesbury. It is bounded by Oxford Road to the north, agricultural fields to the west and south and a residential area to the east. The site is generally flat. Historically, brickearth extraction has taken place within the northern part of the study site. As a result, the natural topography in this area has been altered (CgMs 2018).
- 1.4 The underlying bedrock geology of the area is mapped as Kimmeridge Clay and Gault Formation – mudstone – in the north; Purbeck Group - limestone and argillaceous rocks, interbedded – in the central area; Gault Formation – mudstone – in the south, with superficial deposits of gravels and silts, clays (alluvial) and head deposits (BGS 2018).

2. ARCHAEOLOGICAL BACKGROUND

The archaeological background given below is a succinct summary of the information garnered from an archaeological Desk Based Assessment of the site by CgMs (2018)

Palaeolithic-Mesolithic

- 2.1 Pleistocene mammal remains including fragments from mammoth, woolly rhinoceros, hippopotamus, bear and hyena were found to the north of the site within Locke's Pit and at Starveall. An upper Palaeolithic flint flake as well as Mesolithic flint tools was also found during field walking to the south west of the site at Bishopstone Manor Farm.

Neolithic

- 2.2 Evidence for the Neolithic period is generally noted within the vicinity of the site as flint scatters or isolated finds such as the Neolithic polished flint axe found within the site, as well as other Prehistoric material. Fieldwalking to the south west of the site at Bishopstone Manor Farm found lithics broadly dated to the Prehistoric period, with the density of finds indicating a possible Late Prehistoric settlement. Neolithic flint blades and flakes have also been found to the east and north-west of the site.

Bronze Age

- 2.3 To the east of the site isolated features were found dating to the Late Bronze Age, with evidence of Bronze Age metalworking noted to the east of the site, with the discovery of two hammer stones.

Iron Age

- 2.4 Evidence of Late Bronze Age/Early Iron Age settlement has been found to the north west of the site, including evidence of metalworking. An Iron Age/Roman settlement has been excavated to the north of the site at Coldharbour Farm, while fieldwalking to the south east, south west and west found evidence of Iron Age activity within the area including two coins.

Late Iron Age/Roman

- 2.5 Archaeological investigations in the vicinity show that the site lies within a developed rural landscape with evidence of a Romano-British cemetery, enclosures and settlement.

- 2.6 Late Iron Age and/or Roman cremations were found in a brick pit to the north-west, with the area now classified as an Archaeological Notification Area due to the expectation of further cremations. Just to the north west of the ANA, geophysical surveys showed enclosures assumed to be related to a Romano British settlement.
- 2.7 Within the site itself fieldwalking indicates a small settlement within the centre of the site, with claims of a hoard of Roman coins found in the same field by metal detectorists. To the north of the Roman coins a late Roman ring has also been found. Isolated finds of Roman pottery have also been found at Bishopstone Manor Farm and Stoke Mandeville Hospital.

Anglo Saxon

- 2.8 By the mid-7th century Aylesbury lay in the southern part of the kingdom of Mercia and between 657 AD and 674 AD the Mercian 'Wulfhere' is thought to have founded a church in Aylesbury on or near the present site of St. Mary's Church. The rival kingdom of Wessex lay to the south of the river Thames, which formed the boundary between the two kingdoms. By the 11th century Wessex would subsume Mercia.
- 2.9 Findspots of Saxon pottery indicative of a settlement are recorded to the west around Sedrup Lane, while place names such Sedrup, Hartwell and Tetlow near Bishopstone are indicative of Saxon settlement in the vicinity, but there is no evidence of Saxon activity within the site itself.

Medieval - Post-Medieval

- 2.10 In the Medieval period the site lay within the manor of Hartwell, but outside areas of large scale settlement, with the majority of evidence of this period occurring around the Manors or hamlets of Hartwell, Sedrup, Stoke Halling and Hall End. Large open field agricultural system with its characteristic ridge and furrow earthworks were common in this period with some of these preserved within the site. The majority of the site was probably agricultural land during this period.
- 2.11 Findspots of Medieval material have been found within the centre of the site, during metal detecting and fieldwalking.
- 2.12 The site remained agricultural in nature throughout the post-medieval period.

Recent Work

- 2.13 A geophysical survey of the site was undertaken in November 2017 (Sumo Survey 2017). Three archaeological complexes - settlement sites, were identified along with areas of ridge and furrow cultivation. Other features of potential interest included former field boundaries and areas of alluvial soils. Networks of land drains were mapped along with the alignments of numerous services.

3. AIMS AND OBJECTIVES

- 3.1 The objectives of the evaluation were to provide information about the archaeological resource within the site, including its presence/absence, character, extent, date, integrity, state of preservation and quality. In accordance with *Standard and guidance: Archaeological field evaluation* (ClfA 2014), the evaluation was designed to be minimally intrusive and minimally destructive to archaeological remains. The information gathered has enabled the BCCSAPO to identify and assess the particular significance of any heritage asset, consider the impact of the proposed development upon it, and to avoid or minimise conflict between the heritage asset's conservation and any aspect of the development proposal, in line with the *National Planning Policy Framework* (DCLG 2012).
- 3.2 The archaeological background (provided by the CgMs DBA) and the geophysical survey identified that significant archaeological remains were to be expected, concentrated within specific foci, and in this report, reference will be made to the relevant sections of the regional research framework (i.e. *Solent-Thames Archaeological Research Framework* (Chapters published 2006-2009) [further details of the regional research frameworks available can be found at http://www.algao.org.uk/england/research_frameworks].

4. METHODOLOGY

- 4.1 The first phase of fieldwork comprised the excavation of 104 trenches (30m long and 1.85m wide), in the locations shown on the attached plan (Fig. 2). Three additional trenches were not excavated, one due to environmental constraints, another due to flooding and a third as there was no available access. The trenches were set out on OS National Grid (NGR) co-ordinates using Leica GPS and surveyed in accordance with CA Technical Manual 4 *Survey Manual*. Localised flooding and a seasonally-

high water table meant many archaeological features could not be fully excavated. As a minimum in those circumstances all features were photographed and accurately mapped using GPS, and with the approval of Eliza Alqassar all surface finds were collected. The second phase of the evaluation consisted of the excavation of a further 38 trenches, access was not available to two further trenches.

- 4.2 All trenches were excavated by mechanical excavator equipped with a toothless grading bucket. All machine excavation was undertaken under constant archaeological supervision to the top of the first significant archaeological horizon or the natural substrate, whichever was encountered first. Where archaeological deposits were encountered they were excavated by hand in accordance with CA Technical Manual 1: *Fieldwork Recording Manual*.
- 4.3 Deposits were assessed for their palaeoenvironmental potential in accordance with CA Technical Manual 2: *The Taking and Processing of Environmental and Other Samples from Archaeological Sites* and, 13 were sampled and processed. All artefacts recovered were processed in accordance with Technical Manual 3 *Treatment of Finds Immediately after Excavation*.
- 4.4 The archive and artefacts from the evaluation are currently held by CA at their offices in Andover. Subject to the agreement of the legal landowner the artefacts will be deposited with Buckinghamshire County Museum along with the site archive. A summary of information from this project, set out within Appendix E, will be entered onto the OASIS online database of archaeological projects in Britain.

5. RESULTS (FIGURES 2-18)

- 5.1 This section provides an overview of the evaluation results; detailed summaries of the recorded contexts, finds and environmental samples (palaeo-environmental evidence) are to be found in Appendices A, B and C respectively. The first phase of the evaluation was carried out across 11 fields, the majority of which were subjected to localised flooding, this in combination with a seasonally high water table made the hand excavation of features very difficult and in cases impossible. The locations of **Trenches 4, 5 & 6** were repositioned on the ground due to ecological constraints and for the same reason **Trench 7** could not be excavated. An additional trench

was excavated in **Area 6** and two further contingency trenches were excavated in **Area 11** with the aim of mapping the extent of known archaeological deposits, similarly trench 95 was extended for the same purpose. The second phase of the evaluation was undertaken in two further areas. The locations of five trenches were altered on site to avoid overhead services. The results are summarised in field / area number sequence. The area numbers used on site are based on the geophysical survey area numbers.

- 5.2 The topsoil across the entire site consisted of a grey/brown clay/silt with an average depth of 0.30m; the majority of the trenches also contained a yellow/brown silt/clay subsoil of around 0.15m in depth. To south east of the site within **Areas 11, 16 and 18**, deposits of colluvium (silt/clays) were recorded up to 0.70m in depth. An extant medieval ridge and furrow field system survived within **Area 5** and traces of truncated furrows were recorded cutting the geology in **Areas 7, 9 and 16**. All archaeological features were sealed by the subsoil or colluvium and cut the solid natural substrate. The natural varied across the site from firm silt/clays in the south-east to a mixture of clays, flint gravels and brickearth towards the north-west. Excepting Ridge and Furrow, no archaeological features were observed within **Trenches 4, 5, 8 - 10, 30, 31, 34, 39, 44, 45, 47, 50, 52, 55, 56, 61 - 64, 66, 70, 71, 73, 75, 79, 81, 82, 108, 114 - 116, 118 - 126, 128 - 145**. These trenches are summarised only in Appendix A.

AREA 1 Phase 1

Trench 1 (Figure 2)

- 5.3 **Trench 1** contained a single undated north - west/south- east aligned ditch, **103** measured 1.10m in width and could not be excavated due to flooding of the trench.

Trench 2 (Figures 2 & 3)

- 5.4 A single ditch crossed the trench on a north-south orientation, **203** which could not be fully excavated (due to the high water table) measured 1.41m in width by at least 0.22m in depth. This feature which remains undated extends into **Trench 3**.

Trench 3 (Figures 2 & 3)

- 5.5 **Trench 3** contained a single undated ditch, which could not be excavated and is a continuation of ditch **203** in **Trench 2**.

AREA 2 – Ecologically sensitive area

Trench 6 (Figures 2, 3 & 6)

- 5.6 **Trench 6** contained a number of possible prehistoric features, these comprised linear **604**, which remains unexcavated but which measured 0.80m in width and was filled with brown grey silt/clay. Ditch **606**, which ran parallel to **604**, was an undated U-shaped feature which measured 0.94m in width by 0.45m in depth. Two closely located circular postholes **608** & **612** were recorded roughly 20cm in diameter, both these features remain undated however a third oval shaped post hole **620** measuring 0.29m by 0.26m was filled with a dark grey sand/clay and measured at least 0.27m in depth but was not fully excavated due to the high water table. From within the fill a sherd of later prehistoric pottery and a flint flake were recovered. A shallow U-shaped gully **610** measuring 0.27m wide and 0.13m deep contained two sherds of later prehistoric pottery and three worked flint flakes. Ditch **614** measured 2.07m in width with a maximum depth of 0.72m. The ditch contained two fills; the primary fill a grey brown clay/silt measured 0.17m in depth and underlay a grey clay/silt 0.55m in depth which contained a single piece of burnt flint. All five ditches within the trench are orientated north-west/south-east, and whilst the majority remain undated their common alignment suggests that they are all associated with one another.

AREA 3 - heavily waterlogged area

Trench 29 (Figures 2 & 3)

- 5.7 A single oval pit **2903** extended south from the trench. The pit which measured at least 1.12m in length by 1.30m could not be excavated due to flooding.

Trench 32 (Figure 2 & 3)

- 5.8 Two possible undated pits were recorded extending east from the trench. Pit **3203** measured 0.45m in length by 0.40m and pit **3205** measured 0.35m x 0.30m. Neither pit could be excavated due to flooding.

Trench 33 (Figures 2 & 3)

- 5.9 Three undated ditches were recorded straddling **Trench 33**. All three ran on an approximate west - east alignment and were inundated by the high water table before they could be excavated.

Trench 35 (Figures 2 & 3)

- 5.10 **Trench 35** contained four possible pits and a roughly west - east orientated ditch. None of the features could be excavated due to the rapid flooding of the trench, and remain undated.

AREA 5

Trench 12 (Figures 2, 3 & 7)

- 5.11 The trenches excavated within Area 5 were all excavated through an extant medieval ridge and furrow field system. All features within this area were sealed by a grey/clay subsoil of up to 0.30m in depth.

- 5.12 A single U-shaped Romano-British ditch extended north-west out of the trench, **1203** measured 0.66m in width by 0.25m in depth and underlay the ridge and furrow. A second northwest/south-east ditch **1209** which measured 1.30m in width remains unexcavated due to the high water-table. Two furrows **1205** & **1207**, up to 4m in width were recorded in the trench following a west – east alignment.

Trench 13 (Figures 2 & 3)

- 5.13 Four furrows were identified in the trench and recorded on a west - east alignment. A single possible ditch **1311** 0.74m in width, was mapped underlying the furrows, but could not be excavated due to flooding.

Trench 14 (Figures 2 & 3)

- 5.14 In addition to two probable furrows, three roughly circular pits **1403**, **1405** & **1407**, were recorded. All measured between 0.20-0.40m in diameter but could not be excavated due to the high water table.

Trench 16 (Figures 2 & 3)

- 5.15 **Trench 16** contained two north-west/south-east orientated furrows in addition to a west - east running ditch. The undated ditch, **1607**, measured 0.90m in width and remained unexcavated due to flooding.

Trench 28 (Figures 2 and 3)

- 5.16 A single undated pit **2803** measuring in excess of 0.80m by 0.77m extended south out of the trench in addition to ditch **2805** which measured in excess of 2.90m long by 0.74m wide.

AREA 6**Trench 15 (Figures 2 & 3)**

- 5.17 Two furrows and two undated ditches were recorded in **Trench 15**. Ditch **1506** orientated north-south measured 0.89m in width by 0.29m in depth and **1508** on a rough west-east orientation measured 0.82m by 0.26m. Furrow **1504** appears to continue west up the slope into **Trench 24**.

Trench 17 (Figures 2 & 3)

- 5.18 Three probable ditches were identified in **Trench 17** all on an approximate east-west alignment, one of which corresponded with the geophysical survey and which appears to continue into **Trench 22**. Due to the high water table, none of the three ditches could be excavated. However since they did not appear to follow the current boundary alignments, it is assumed that they pre-date the post-medieval period.

Trench 18 (Figures 2 & 3)

- 5.19 Two ditches were recorded within **Trench 18**; ditch **1803** measured 1.26m wide and 0.49m in depth and a piece of iron working slag was recovered from its fill. The second ditch, **1805**, which ran almost the entire length of the trench (i.e. east-west) measured at least 20m in length by 0.62m in width and 0.21m in depth, and contained a fragment of a fired clay loom weight, Romano-British pottery/bone and CBM. The ditch appears to continue east into **Trench 22**.

Trench 19 (Figures 2 & 3)

- 5.20 Ditch **1903** runs west - east at the southern end of the trench and corresponds to a linear feature shown on the geophysical survey. The ditch which is a continuation of ditch **1805** in **Trench 18** could not be excavated.

Trench 20 (Figures 2, 3 & 8)

- 5.21 A Romano-British ditch (**2003**), crossed the trench on a north-south orientation. The ditch which measured 1.89m by 0.68m in depth contained a small quantity of second century pottery. Immediately west of the ditch, pit **2005** extended south out of the

trench. The pit which measured 0.88m in length by 0.71m in width and 0.31m in depth contained pottery dateable to the second – fourth centuries, bone and CBM.

Trench 21 (Figures 2 & 3)

- 5.22 Two small pits/post holes and a ditch were recorded in **Trench 21**, none of which could be excavated due to localised flooding. Pit **2103** which contained Romano-British pottery measured 0.45m x 0.40m and extended north out of the trench. Posthole **2105** measured 0.30m in diameter and ditch **2107** measured 0.90m in width and contained a small quantity of Romano-British pottery and CBM.

Trench 22 (Figures 2 & 3)

- 5.23 At the northern end of trench two Romano-British ditches formed a T-junction. Ditch **2203** appeared to be cut by **2205**. The former ditch measured 0.40m in width and extended northwards out of the trench. Ditch **2205** which contained Romano-British pottery measured 1.60m in width. Five other undated ditches/furrows were identified within the trench all aligned west- east. Two of the furrows appear to continue east into **Trench 25**.

Trench 23 (Figures 2 & 3)

- 5.24 Two ditches were recorded in **Trench 23** on an approximate south-west/north-east alignment. Ditch **2303** measured 1.25m in width by 0.22m in depth. This feature, which had an uneven profile, was located close to ditch **2305**, which measured 0.90m in width by 0.27m in depth. Neither feature contained any dateable material.

Trench 24 (Figures 2 & 3)

- 5.25 A single, possible, undated ditch/furrow, **2403**, straddled the trench, and measured up to 1.6m in width. The feature was aligned approximately south-west/north-east and appeared to continue towards **Trench 15**.

Trench 25 (Figures 2 & 3)

- 5.26 Three undated ditches/furrows straddled the trench on a west - east orientation; these could not be excavated due to the existing water table, but all appeared to continue west into **Trench 22**.

Trench 26 (Figures 2 & 3)

- 5.27 Two possible furrows/ditches were recorded on an approximate west - east orientation. Neither could be excavated due to the high water table.

Trench 27 (Figures 2 & 3)

- 5.28 **Trench 27** flooded immediately upon excavation. A number of archaeological features were identified. These consisted of pit **2703** which extended south out of the trench; it measured 1.12m by 0.70m. Ditch **2705** running north - south and which measured 1.30m in width and which contained several sherds of late prehistoric pottery and pit **2707** which extended east out of the trench, it measured at least 1.62m by 0.62m and contained late Iron Age/Romano-British pottery.

AREA 7 - Raised Brickearth Island within Flood Plain**Trench 38 (Figures 2 & 3)**

- 5.29 A single undated ditch crossed **Trench 38** on a west - east orientation. Ditch **3803** measured 1.5m in width and appeared to be cut by a possible pit which extended east out of the trench. The pit **3805** measured at least 1m in length by 0.95m in width. Neither of the features could be excavated due to flooding as a result of the high water table.

Trench 41 (Figures 2 & 3)

- 5.30 Within the brickearth of **Trench 41** a single (possible), post hole, **4102**, was identified close to the western end of the trench. The feature, which measured 0.25m by 0.17m, could not be excavated due to the flooded nature of the trench.

Trench 43 (Figures 2 & 3)

- 5.31 A possible ditch **4302** straddled the trench on a west – east orientation, this undated feature, which measured up to a metre in width, could not be excavated due to the flooding within the trench.

Trench 46 (Figures 2 & 3)

- 5.32 A late prehistoric U-shaped ditch crossed **Trench 46** on a north-south orientation. Ditch **4605** measured 1.30m in width by 0.57m in depth and was filled with yellow brown/clay silt. Pottery, Oyster shell and animal bones were recovered from the ditch.

Trench 48 (Figures 2 & 3)

- 5.33 A possible ditch and a post hole were recorded at the southern end of **Trench 48**. Post hole, **4804**, measured 0.48m in diameter by 0.20m in depth. Ditch **4806** which extends east out of the trench measured 0.52m in width by 0.30m in depth. Both features remain undated.

Trench 49 (Figures 2, 3 & 9)

- 5.34 A shallow ditch, **4903**, containing animal bone and scorched clay/charcoal straddled **Trench 49** on a west – east orientation; the composition of the fill, which unfortunately could not be sampled before becoming inundated by the high water table, indicates that ditch had been backfilled with the raking out of a domestic oven/hearth probably from a location in the immediate vicinity. Two inter-cutting pits **4905/4907** which extended west out of the trench were located next to the ditch. Pit **4905** measured 1.98m in length by at least 1m in width and 0.45m in depth and contained animal bone fragments, the second undated pit, **4907** appeared to cut **4905** and measured 2.3m in length by 2m in width by 0.38m in depth.

Trench 51 (Figures 2 & 3)

- 5.35 Two possible furrows were recorded within **Trench 51** but could not be further investigated due to flooding.

Trench 53 (Figs 2, 3 & 10)

- 5.36 Located on the crest of the hill, **Trench 53** contained the graves of two individuals. Both were closely associated, west – east orientated, extended supine inhumation burials. No individual grave cuts were recognisable within the brickearth, however the skeleton of a robust adult extended west out of the trench. Burial, **SK5306**, measured at least 1.15m in length and lay immediately south of a more fragmentary burial **SK 5303**. The latter individual represents the remains of a juvenile with a visible length of 1.16m recorded. A single sherd of late prehistoric pottery was collected from the soil around adult burial (**5307**). The remains of the two individuals were mapped and remain *in situ* and may represent part of larger cemetery presumably associated with a contemporary farmstead located on the hilltop. An occupation soil containing clay silts was recorded within the brickearth throughout the length of **Trench 53**. Test pit **5315** contained late prehistoric pottery.

Trench 54 (Figures 2 & 3)

- 5.37 A single probable pit extended south out **Trench 54**, it measured 0.85m by 0.80m but could not be excavated.

Trench 57 (Figures 2 & 3)

- 5.38 **Trench 57** contained three pits and a ditch. Pit, **5703**, oval in plan measured 0.87m in length by 0.54m in width by 0.19m in depth; the fill, a yellow/brown clay/silt contained late prehistoric pottery. A second oval pit, **5705**, measuring 0.73m by 0.48m by 0.17m was found to contain burnt CBM. The third pit **5709**, measuring 1.32m in length by at least 0.56m in width and 0.12m in depth contained late prehistoric pottery and worked flint. A probable enclosure ditch **5707** which ran north - south across the trench measured 1.47m in width by 0.43m in depth, the otherwise undated grey/brown clay/silt contained animal bone fragments.

AREA 8**Trench 58 (Figures 2 & 4)**

- 5.39 Three, west - east orientated ditches, **5803**, **5805** & **5807** were identified within Trench 58; the average width of the ditches straddling the trench was c. 1.5m. These features remained unexcavated due to the high water table.

Trench 59 (Figures 2 & 4)

- 5.40 Five undated ditches were recorded within **Trench 59**, **5903** terminated within the trench and measured 0.39m in width by 0.12m in depth. Ditches, **5905**, **5907** & **5913** were inter-connected and probably represent part of an enclosure/field system: **5907** is a U-shaped ditch measuring 0.82m in width by 0.45m in depth. At the western end of the trench, ditch **5911** spanned the trench and measured 0.58m in width.

Trench 60 (Figures 2 & 4)

- 5.41 A single undated ditch, **6002** spanned **Trench 60** on a south-west/north-east orientation. The ditch which measured 0.80m in width was filled with grey/brown clay/silt 0.30m in depth.

Trench 67 (Figures 2 & 4)

- 5.42 Two narrow ditches were recorded crossing **Trench 67** on a north-east/south-west orientation. Ditch **6705** measured 0.87m in width by 0.26m in depth and was found

to contain modern CBM inclusions. Ditch, **6703**, which measured 0.54m in width, remained unexcavated.

AREA 9

Trench 65 (Figures 2 & 4)

- 5.43 A south-west/north-east orientated ditch crossed the southern end of **Trench 65**, **6504** measured 1.24m in width by 0.32m in depth. The U-shaped ditch remains undated and was dug through a very high water table.

Trench 68 (Figures 2 & 4)

- 5.44 Ditch **6803** which measured 1.41m in width by 0.50m in depth corresponds with a geophysical anomaly which spans the trench on a north-west/south-east orientation. The fill which remains undated consisted of brown/grey clay/silt.

Trench 69 (Figures 2 & 4)

- 5.45 **Trench 69** contained a possible pit at the western end of the trench 0.40m in length by 0.25m in width in addition to a rough north - south orientated ditch 0.60m in width. Neither feature could be excavated due to localised flooding.

Trench 72 (Figures 2 & 4)

- 5.46 Four discrete undated features were recorded within **Trench 72**, these consisted of **7203**, a possible pit measuring 1.05m by 0.95m, **7205**, a pit roughly 1m in diameter, **7207** a pit measuring 1.20m by 0.96m and **7209** a probable pit measuring 1.28m by at least 0.63m (which extended west out of the trench). None of the features could be excavated due to the high water table.

Trench 74 (Figures 2 & 4)

- 5.47 Three small undated ditches spanned **Trench 74** on an approximate north - south alignment. The central ditch **7407** appears to be a continuation of ditch **6803** in **Trench 68** and which corresponded with an anomaly on the geophysical survey. The two other ditches **7405** and **7409** remained unexcavated due to the high water table.

Trench 76 (Figures 2 & 4)

- 5.48 A possible ditch, **7603**, extended beyond the northern end of **Trench 76**; pit **7605** (which measured a minimum of 0.55m by 0.20m) extended west out of the trench. Two possible furrows and a ditch (**7611**) spanned the trench on a rough north -

south orientation. The ditch measured 2.30m in width, but could not be further excavated due to the high water table.

Trench 77 (Figures 2 & 4)

- 5.49 A number of features were recorded in **Trench 77**; these consisted of an oval shaped Late Iron Age/Romano-British pit, **7703**, which measured 0.90m by 0.75m by 0.20m in depth. Ditch **7705** measured 1.48m by 0.52m and contained brown/grey silt/clay with late medieval pottery, bone and CBM. At the southern end of the trench were a parallel pair of gullies, **7709** and **7711**, both of which measured 0.80m in width by 0.15m in depth, the latter contained late Romano-British pottery.

Trench 78 (Figures 2, 4 & 11)

- 5.51 The northern end of **Trench 78** contained a Romano-British ditch, **7805**, this feature measured 0.80m in width by 0.35m in depth and was filled by grey/brown sand/clay. The southern end of the trench contained a large boundary ditch consisting of at least three separate ditches; the southern-most ditch **7807**, measured 1.87m in width with a depth of at least 0.70m. The fill consisted of brown/grey silt/clay and contained a quantity of Iron Age pottery. The central ditch **7809** measured 0.41m in width by 0.27m in depth and contained Romano-British pottery. The third ditch, **7811**, measured 1.14m in width by 0.45m in depth and was filled with grey/brown silt/clay which included Iron Age/Romano-British pottery and slag.

Area 10

Trench 83 (Figures 2 & 4)

- 5.52 A late prehistoric ditch, **8304**, spanned the trench on a west - east orientation, and measured 1.11m in width by 0.66m in depth and was filled with grey/brown silt/clay with Late Iron Age pottery. A possible recut to the ditch or possibly pit partially cut the ditch. This later feature **8306** measured 0.96m in width by 0.41m in depth and extended east out of the trench.

Trench 84 (Figures 2 & 4)

- 5.53 **Trench 84** is clearly located over an occupation area consisting largely of grey/brown Late Iron Age/Romano-British 'occupation soils' (**8403 – 8408**) which extend out around the trench. Visible within the occupation soils were a pit, **8409**, which extended west out from the trench and measured at least 0.62m by 0.50m; **8411**, a possible ditch/occupation spread 3.10m in width and pit, **8413** which

measured 1.10m by 0.64m and 0.16m in depth, the red brown silt/clay fill, contained late prehistoric pottery and worked flint.

Trench 85 (Figures 2 & 4)

- 5.54 Ditch **8505** was aligned approximately north – south within **Trench 85**. The feature which sits within an occupation soil (**8303**) measured 1.24m in width and was filled with **8506** a grey clay/silt which contained late prehistoric and Romano-British pottery. A second possible ditch **8507** was observed but not fully exposed at the southern end of the trench in addition to **8509** a probable pit, 0.50m in diameter.

Trench 94 (Figures 2 & 4)

- 5.55 Three ditches spanned **Trench 94**; **9403** at the eastern end of the trench measured 1.43m in width by 0.31m in depth and was filled with a grey silt/clay which contained at least 5 large flint nodules, which may represent demolition materials from a nearby structure; ditches **9405** and **9409** both spanned the trench on a west – east orientation and contained Romano-British pottery. Two pits **9407** and **9409** were also recorded extending out from the trench.

Trench 95 (Figs 2, 4 & 14)

- 5.56 **Trench 95** was extended 10m to both the north and south, into a cruciform shape to investigate the possibility that the trench might contain a possible Romano-British wall. Running for in excess of 4m, **9517** is a 0.30m wide channel filled with compacted limestone rubble (**9510**) with pale brown sand/clay packing. No return to a wall was recorded within the trench extensions. A grey/brown occupation soil **9509/9519** extended 2.5m to either side of this feature. The excavation of a hand dug trial pit against the possible wall, through the occupation soil, revealed the wall and deposit to measure at least 0.10m in depth. The possible wall remains *in situ* and was not disturbed within the trench. The possible wall overlies a Romano-British ditch **9511** which runs for the length of the 20m long trench extension and which contained **9512** a moderate quantity of cut limestone tesserae, Romano-British pottery and animal bone. The ditch measured at least 1.28m in width by at least 0.38m in depth, this feature could not be fully bottomed due to the high water table. Pit **9506** which extended south out of the trench measured at least 1.54m in length by 1.80m in width by 0.09m in depth. The pit which cuts occupation soil **9509** contained a dark grey/brown silt/clay fill with moderate quantities of cut limestone tesserae, pottery and animal bone and is possibly contemporary to ditch fill **9512**.

Two discrete features were also recorded within the trench; **9513** measured 0.48m in length by 0.44m in width and 0.25m in depth and was cut by ditch **9511**. No finds were recovered from the fill, red brown silt/clay. Pit **9504** measured 0.74m by 0.39m and remained unexcavated.

Trench 96 (Figures 2 & 4)

- 5.57 **Trench 96** was flooded and could not be excavated but was seen to contain two ditches (**9607** & **9612**), an 'occupation soil' (**9614**) and three pits (**9603**, **9605** & **9609**). Romano-British pottery and CBM were recovered from the trench.

Trench 97 (Figures 2 & 4)

- 5.58 **Trench 97** was flooded and could not be excavated but was seen to contain five ditches (**9703**, **9705**, **9707**, **9710** & **9714**) all approximately aligned north-west/south-east. Three post holes / pits were also recorded (**9708**, **9712** & **9716**)

Area 11

Trench 86 (Figures 2 & 4)

- 5.59 A small pit/posthole, **8603** was located at the southern end of **Trench 86**, this feature some 0.30m in diameter sat at the edge of occupation layer **8605**, a dark grey silt/clay spread. A possible beam slot/elongated pit **8607**, extended south from the trench, the feature measured 1m in length by 0.60m in width by 0.12m in depth and contained late prehistoric pottery and CBM fragments. At the northern end of the trench ditch **8609** spanned the trench, the feature measured 1.82m wide by 0.56m in depth and contained two fills, the primary fill **8610**, a sand/clay contained Iron Age pottery and underlay **8611**, a sand/silt/clay containing large quantities of Iron Age/Romano-British pottery.

Trench 87 (Figs 2, 4 & 12)

- 5.60 A large number of archaeological features were recorded in **Trench 87**, these comprised; ditch **8703** which clipped the western end of the trench, small pit/posthole, **8705**, which measured 0.41m by 0.35m, and ditch **8705**, which ran north-east/south-west and which measured 2.39m wide by 0.32m deep. The fill of the latter comprised a grey/brown silt/clay containing animal bones. A stratigraphically later pit, **8722**, cut ditch **8702** and measured 1.03m by 0.58m by 0.31m deep, it contained CBM and animal bone. Pit **8709**, extended north out of the

trench and measured at least 0.87m by 0.50m. Two further small pits/postholes **8711** and **8717** measured respectively 0.90m by 0.60m and 0.30m deep. Ditch **8713**, spanned the centre of the trench, it measured 0.92m wide by 0.34m and contained animal bone and CBM. At the eastern end of the trench **8719**, a probable occupation spread, extended out of the trench. A north-south orientated inhumation burial extended (north) out from the centre of the trench. Burial **8715** measured at least 0.79m by 0.54m in width and contained the legs of a supine extended burial **SK 8721**. A sherd of Iron Age/Romano-British pottery was found within the grave fill. The burial was mapped and remains *in situ*.

Trench 88 (Figures 2 & 4)

- 5.62 Five probable drainage/boundary ditches were recorded within **Trench 88 (8802, 8805, 8809, 8817 & 8819)**, all appear to run west-east; a small quantity of Iron Age/Romano-British pottery was recovered from them. A 1m wide slot through **8805** demonstrated it measured 0.92m wide by 0.11m in depth and contained Romano-British pottery. Four pits were also recorded within the trench; **8807, 8811, 8813 & 8815**, they ranged from 0.30m to 2.30m in diameter.

Trench 89 (Figures 2 & 4)

- 5.63 Four ditches spanned **Trench 89 (8905, 8907, 8911 & 8913)**, on a north-west / south – east orientation. Despite the trench rapidly flooding a slot through **8913** demonstrated it measured 0.97m by 0.32m in depth. A small quantity of Romano-British pottery was recovered.

Trench 90 (Figures 2 & 4)

- 5.64 The trench was dominated by a north – south enclosure ditch **9009**, with smaller ditches **9005, 9007** and **9013** branching off to the east. The main spinal ditch **9009** measured c. 20m in length, a 1m wide hand dug slot showed the U-shaped ditch to measure 0.90m wide by 0.30m deep, fragments of Romano-British pottery, bone and CBM were recovered. Further Roman finds were recovered from a separate west-east orientated ditch **9015** at the north end of the trench. Two possible small pits 0.30m in diameter were also recorded in addition to **9012**, a surviving dark occupation soil.

Trench 91 (Figures 2 & 4)

- 5.65 A wide flat bottomed ditch **9103** spanned the trench; it measured 1.23m wide by 0.21m deep and was filled with a brown/grey clay/silt.

Trench 92 (Fig 2)

- 5.66 Two parallel ditches spanned the southern end of the trench, **9203** measured 0.78m by 0.21m in depth and was filled with grey/brown clay/silt which contained late prehistoric pottery. Ditch **9205**, measured 1.71m wide by 0.39m deep and contained dark grey silt/clay with Romano-British pottery, bone and tegula. Extending west out of the centre of the trench was **9207**, an amorphous spread of grey silt/clay some 8.25m by 0.79m which may represent an occupation spread beyond the trench. A further occupation spread occupies the northeast end of the trench, **9209** comprising a grey/brown silt/clay within which pit **9211** was evident. This feature some 0.50m in diameter was filled with grey silt/clay.

Trench 93 (Figures 2, 4 & 13)

- 5.67 A dark grey occupation soil ran along the length of **Trench 93**, beneath which a large number of settlement related features were evident, these include pits **9303**, **9307**, **9309**, **9311** and **9330**. To the south, ditch **9305** spanned the trench this measured 1.06m in width by 0.10m in depth and contained late prehistoric pot. The northern end of the trench was dominated by six intercutting/overlying ditches. The earliest (stratigraphically) appears to be **9323** which measured 1.69m wide and underlay ditches **9315**, **9321** and **9317**. Ditch **9313** also spanned the trench and appeared to merge into ditch **9315**, which measured up to 0.95m wide. A sectional slot failed to identify a relationship between the two ditches. Ditch **9315** is curvilinear in plan and is cut by **9317**, a very dark Romano-British ditch which is very similar in nature to ditch **9319** which runs immediately to the north; ditch **9315** also appears to be cut by **9321** a north-west/south-east aligned ditch.

Trench 99 (Figures 2 & 4)

- 5.68 The trench contained two post holes and a series of six ditches spanning the trench. Hand dug slots were excavated through three of the probable U-shaped enclosure ditches. Ditch **9909** which measured 2.11m in width by 0.42m in depth could not be bottomed due to the high water table but was found to contain Roman pottery, cbm and animal bone. The second ditch **9919** measured 1.65m in width by 0.66m in

depth and contained Romano-British pottery dating from 2nd to 4th Century, in addition to a dump of possible demolition rubble composed of unworked limestone slabs measuring approximately 0.3m x 0.15m x 0.15m. The third excavated ditch **9921** measured 0.95m wide and 0.30m deep also contained Romano-British pottery and intrusive post medieval pottery and animal bone.

Trench 100 (Figures 2 & 4)

- 5.69 Trench **100** contained two ditches (**10005 & 10007**) each approximately 2m wide and running on an approximate north-south alignment and an oval pit which extended north out of the trench. Pit **10003** measured at least 0.66m by 0.57m. None of the features could be excavated due to the high water table.

Trench 101 (Figures 2 & 4)

- 5.70 Two undated north-west/south-east oriented ditches spanned the trench and appear to continue into **Trench 201**. Ditch **10107** was not fully revealed within the trench and could not be excavated, ditch **10109** measured 1.95m in width. The excavation ceased at 0.13m in depth due to the high water table. Two, small, circular pits (**10105** and **10107**), which measured 0.45m and 0.33m in diameter respectively remained unexcavated.

Trench 102 (Figures 2 & 4)

- 5.71 Two small and probably naturally occurring features were recorded in **Trench 102**. Both are undated hollows and appear to be the result of bioturbation.

Trench 103 (Figures 2 & 4)

- 5.72 A single north-west/south-east u-shaped ditch (**10303**) spanned the trench, measuring 1.3m wide and 0.32m in deep; it did not produce any dating evidence. A possible undated pit/posthole **10305** was recorded in plan measuring 0.25m in diameter but due to the water table in that part of the trench remained unexcavated.

Trench 104 (Figures 2, 4 & 15)

- 5.73 The entire length of **Trench 12** consisted of a dark grey silt/clay 'occupation soil' up to 0.25m in depth, **10402** was sealed by the subsoil and directly overlaid the natural substrate. A machine dug sondage confirmed the depths of the soil. The trench

rapidly flooded before further hand exploration could be carried out. This deposit appears to continue into **Trench 105**.

Trench 105 (Figures 2 & 4)

- 5.74 Within **Trench 105** a dark grey silty clay 'occupation soil' **10503** was identified with an average depth of 0.15m similar in nature to the deposit throughout **Trench 104**. A number of features were visible beneath the deposit. Ditches **10504** and **10506** spanned the trench on a north-south orientation at the western end of the trench; the former measured 2.73m wide and the latter 1.90m. Ditch **10508** which measured in excess of 4m long within the trench by 0.60m wide and 0.18m in depth contained Roman pottery. A deliberate spread of redeposited limestone rubble, **10512**, 0.80m in diameter is undated but could represent the remains of a post pad or similar foundation feature.

Trench 107 (Figures 2 & 4)

- 5.75 A single ditch was recorded at the eastern end of **Trench 107**. Ditch **10703** measured 0.89m and 0.22m in deep and contained Romano-British pottery from the middle 3rd–4th centuries.

Trench 109 (Figures 2 & 4)

- 5.76 Two small possible pits were recorded within **Trench 109**, **10903** an oval feature measuring 0.50m by 0.46m contained a small quantity of burnt flint and animal bone within its fill. Another, similar, possible pit, **10905**, measured 0.57m by 0.54m but was not excavated.

Trench 110 (Figures 2 & 4)

- 5.77 A single undated ditch, **11003**, measuring 0.85m wide spanned the trench but could not be excavated due to the high water table.

Trench 200 (Figures 2 & 4) additional contingency trench

- 5.78 Four undated ditches spanned the trench; three closely located (**20003**, **20005** & **20007**) all were aligned north-east/south-west, whilst **20013** ran roughly north – south. Three possible round pits measuring between 0.40 and 0.50m in diameter were also recorded. None of these features could be excavated due to rapid deep flooding within the trench.

Trench 201 (Figures 2 & 4) additional contingency trench

- 5.79 Two undated ditches orientated north-west/south-east spanned the trench. It is likely these two features are continuations of two boundary ditches recorded in **Trench 101**. Two oval pits were also noted; **20109** measured 0.96m by 0.82m and extended eastwards out of the trench. Pit **20113** measured 2m by 1.72m. None of these features could be excavated due to rapid, deep, flooding within the trench.

AREA 16: Phase 2**Trench 117 (Figures 2, 5 & 16)**

- 5.80 A single pit, sub-oval in plan, was recorded in **Trench 117**. Pit, **11702**, measured 0.72m by 0.41m wide and was 0.30m deep. The upper fill (**11703**) comprised dark grey silty/clay was 0.25m in depth and contained a moderate quantity of Late Bronze Age/Early Iron Age pottery from at least two vessels in addition to fragments of sheep/goat bones. The primary fill, **11706** up to 0.05m in depth also contained late prehistoric pottery. As a consequence the pit was 100% excavated and the soil retained as environmental sample <14>. A furrow and a modern land drain was also noted within the trench.

Trench 127 (Figs 2, 5 & 17)

- 5.81 A broad flat bottomed Romano-British enclosure ditch spanned the northern end of the trench; **12703** measured 2.01m wide by 0.41m deep and was filled with a yellow/brown silt/clay and contained a large proportion of a single black slipped grey fabric flagon of Roman date. Immediately south of the ditch a narrow north-west/south-east aligned gully, **12707**, crossed the trench, this undated feature measured at least 3m in length by 0.55m in width and 0.12m in depth. A grubbed out field boundary spanned the trench to the south; ditch **12705** which survives intact as a hedgerow further to the west, is indicated on the 1877 Ordnance Survey map as a hedge line and is believed to have been extant as recently as 1982.

Trench 146 (Fig 2)

- 5.82 Boundary ditch **14603** spanned the trench and measured 0.8m wide by 0.14m deep; the undated fill consisted of a compacted grey/brown clay.

Trench 147 (Figures 2 & 5)

- 5.83 A single ditch was recorded in **Trench 147**; **14703** spanned the trench on a north-east/south-west orientation and measured 1.47m wide by 0.48m deep. The single fill contained Romano-British pottery and may extend north-east into **Trench 148**.

Trench 148 (Figures 2 & 5)

- 5.84 A pair of undated parallel ditches crossed **Trench 148** on a north-east/south-west orientation. These shallow features run on the same alignment as the ditch in **Trench 147** and may represent part of the same field boundary. Ditch **14803** measured 0.70m wide by 0.18m deep and was immediately west of ditch **14805** which measured 0.88m wide by 0.22m deep.

Trench 149 (Figures 2, 5 & 18)

- 5.85 A series of probable enclosure ditches were recorded in **Trench 149**, they comprised **14903**, a small gully, which appeared to terminate within the trench, it measured at least 3m in length by 0.40m wide and 0.08m in depth. Ditch **14907** which contained animal bone fragments ran north-south for 5m and measured 0.98m wide by 0.40m deep before merging with a larger west-east orientated ditch (**14910**) which was not fully exposed within the boundaries of the trench. A second small gully **14905** merged with ditch **14907** and measured a maximum of 0.15m wide by 0.06m deep. Two larger ditches spanned the trench. Ditch **14915** which included two recuts measured a combined width of 3m by a depth of 0.40m. A u-shaped ditch, **14917**, which had been partially truncated by a modern storm drain and which contained probable medieval pottery and animal bone measured at least 1.5m in width by 0.50m in depth. A possible occupation soil **14924** overlay the most southerly ditches and was composed of grey/brown clay/silt up to 0.23m in depth.

Trench 150 (Figures 2 & 5)

- 5.86 Two shallow ditches were recorded in **Trench 150**; **15003** measured 0.90m wide by 0.11m deep and **15005** which measured 1m in width by 0.16m in depth contained a worked CBM object (RA100).

6. FINDS

6.1 Artefactual material recovered from the evaluation is listed in Appendix B and discussed further below. The recovered material dates from the prehistoric to modern periods. Artefactual material was hand-recovered and via bulk soil sampling of nine deposits. Quantities of the artefact types are given in Appendix B. Codes used in the recording of pottery fabrics are defined in Appendix B. Where possible, those matching the National Roman Fabric Reference Collection (Tomber and Dore 1998) and Oxfordshire medieval type series (Mellor 1994) have been applied and given in bold. A full catalogue is available in the archive.

Pottery

6.2 A total of 913 sherds of pottery, weighing 15210g, was recovered from 108 deposits, including 13 sherds (65g) recovered by bulk soil sample of six deposits, and as unstratified material. The earliest material is dated to the prehistoric period and the latest is of 18th to 19th century date, whilst the majority of sherds date to the Iron Age and Roman periods. The level of fragmentation at the site is variable but fits in with expected patterns. The prehistoric material is highly fragmented, with a mean sherd weight of 4.7g. The less fragile fabrics of the Iron Age/Roman and Medieval periods are characterised by low fragmentation, with mean sherd weights of 16.8g and 15.9g respectively. The small group of post-medieval pottery is moderately-fragmented with a mean sherd weight of 21.6g

Late Prehistoric

6.3 A total of 444 sherds (7280g) of pottery dateable to the late Prehistoric period was recovered from 33 deposits. The group is mostly composed of bodysherds, making refinement of the dating and identification of forms difficult. The group comprises handmade fabrics typical of Prehistoric material in the region including flint, grog and shell-tempered fabrics. Quartz-rich fabrics are also present. The group includes rim sherds from two vessels from pit **5709** (fill **5710**). The rim forms are everted and thickened, and are probably of Iron Age date. Pit **11703** (fill **11704**) produced 29 sherds (415g) of limestone, quartz and calcined flint-tempered fabric. The vessel features an everted rim with fingertip decoration and is of probable late Bronze Age or early Iron Age date.

'Transitional' Late Iron Age and Roman

- 6.4 A total of 323 sherds (6536g) of pottery spanning the transitional period from the Late Iron Age to Early Roman periods (c. 1st centuries BC/AD), was recovered from 15 deposits and as unstratified material. The group has a limited range, consisting of flint-tempered, grog-tempered and quartz-rich fabrics. This is in keeping with other Iron Age assemblages, for example at Broughton Manor Farm (Percival 2014) and Weedon Hill (WA 2007). The large majority consists of wheelthrown grog-tempered types in the 'Belgic' tradition. An almost complete jar, Ra. 5, was recovered from ditch **8609** (fill **8610**). It is a large high-shouldered vessel with out-turned rim, its form and fabric consistent with a mid to late 1st century date. Other jars, of probable similar dating, were recovered from furrow **1603** (fill **1604**), subsoil **7701** and ditches **8609** (fills **8610** and **8611**) and **8713** (fill **87154**). Ditch **7807** (fill **7808**) produced a perforated base plate, probably from a strainer.

Roman

- 6.5 The Roman assemblage suggests a substantial Roman settlement in the vicinity. The group comprises imported wares (samian) and Romano-British finewares, along with small proportions of specialist wares (amphorae).

Imported wares

- 6.6 Thirteen sherds of samian ware were recovered from seven deposits. Both central and East workshops are represented. The vessels are limited to dishes/bowls. A central Gaulish form 18/31R was recovered from ditch **9909** (fill **9910**) and is dateable from the Hadrianic to early Antonine periods (c. AD 120-150). An East Gaulish form 31, recovered from ditch **2203** (fill **2204**) is of mid-2nd to mid-3rd century date. Vessels of uncertain specific form were also recovered from ditches **9919** and **9921**. Decorated sherds were present from ditch **9909** (fill **9910**). Other imported wares are limited to a single sherd of probable Baetican amphora recovered from subsoil **9201**.

Romano-British wares

- 6.7 The majority of the Roman group comprises coarsewares, totalling 365 sherds (6350g). In common with most Roman assemblages from the area, a large proportion of the assemblage consists of greywares (102 sherds weighing 1462g). These, and the remainder of coarsewares are likely to be locally-produced and numerous kilns operate in the area that could feasibly have served sites in the Aylesbury area. Other reduced wares recorded at the site include grog and shell-tempered fabrics and

quartz-rich fabrics including locally-produced black sandy variants. Oxidised, buff-firing and white-firing fabrics make up just under 15% of the total Roman assemblage and this group includes a small number of sherds in pink grog-tempered ware (**PNK GT**).

6.8 Regionally-imported fabrics are also present within the assemblage, although typically in smaller quantities than their locally-produced counterparts (under 6%). The group includes South-Midlands Romano-British shelly wares (**ROB SH**), South-East Dorset Black-burnished ware (**DOR BB1**) and Oxfordshire white wares (**OXF WH**) and red-slipped ware (**OXF RS**).

6.9 Rim sherds from a total of 38 vessels were identified within the Romano-British wares. Most among the group are jars (23), which occur in a variety of fabrics including among the greywares, sandy wares, oxidised and shell-tempered types. A South-East Dorset Black-burnished ware jar, from ditch **9411** (fill **9412**) is too fragmentary to classify further. Bowls and dishes are also plentiful and 12 are represented in the group. Among the fineware types is a Young (2000) form C75-78 bowl in fabric OXF RS, which is dateable to the 4th century. Coarseware forms include a Seager Smith Type 20 plain-rim dish from ditch **1203** (fill **1204**, ditch/furrow **2603** (fill **2604**) and subsoil **9601** and a reed-rimmed bowl of uncertain type, occurring in a white-firing fabric, from occupation layer **9925**. A beaker occurring in a greyware fabric was recovered from ditch **10508** (fill **10509**). An almost complete but heavily fragmented, flagon was recovered from ditch **12703** (fill **12704**). The vessel is provisionally identified as Lower Nene Valley colour-coated ware (**LNV CC**). It features bands of rouletted decoration and its form is close to no. 68, illustrated by Howe *et. al* (1980), and dated to the 4th century date.

Medieval

6.10 A small assemblage (5 sherds, weighing 126g) of medieval-dated sherds was recovered from three deposits. The group comprises hard-fired, quartz-rich fabrics of uncertain production centre.

Post-medieval

6.11 A small proportion of post-medieval pottery was recovered from 11 deposits. The group is dominated by glazed earthenwares (GEW; nine sherds, 220g), broadly of mid-16th to 18th century date. The remaining sherds are of Frechen stoneware recovered from ditch **1307** (fill **1308**), of mid-16th and 17th century date and a sherd

of black glazed earthenware recovered from subsoil **9001**, of 18th and 19th century date.

Other Finds

Worked Stone and Ceramic Building Material (CBM)

- 6.12 A total of 188 fragments of ceramic building material (11208g) was recovered from 50 deposits. Additionally, a total of 296 items of worked or utilised stone (8790g) was recovered from thirteen deposits. The CBM group is dominated by curved and flat tile fragments, and the stone by limestone tesserae.
- 6.13 Whilst the majority of the CBM tile is not tightly dateable, the diagnostic pieces comprise Roman *tegula*, which were recovered from **Trenches 95, 96, 98** and **99**. **Trench 95** also produced the bulk of the worked stone group, chiefly limestone *tesserae* (273 in total) with pit **9506** (fill **9507**) producing the majority, totalling 227. Trench 95 also produced the bulk of the worked stone group, chiefly limestone *tesserae* (273 in total) with pit **9506** (fill **9507**) producing the majority, totalling 227. Small numbers of the *tesserae* have traces of pinkish mortar adhering to their edges, indicating prior use. They are fairly irregular and coarse (typically 35mm x 20mm) and this, together with the uniform colouration may indicate derivation from a plain tessellated pavement or a portion of the plain 'ground' in a polychrome mosaic. Their recovery as a discrete group from a pit may be evidence of repair or demolition. In either case the *tesserae* are good evidence for the presence of a significant Roman building in the immediate area.
- 6.14 The majority of the remaining worked stone pieces are of flat limestone which may be for local *tesserae* production or for use as roofing. This group of CBM and worked stone together is suggestive of a significant Roman building in this immediate area.
- 6.15 Of note in the CBM group is Ra. 100, a piece of flat tile reworked into a disc, of uncertain date and function, recovered from ditch **15005** (fill **15006**). The remainder of the tile cannot be securely dated, and can be of Roman to post-medieval date. The fabrics and firing characteristics of the group is relatively homogeneous and little differences are observed.

Other Finds

- 6.16 A total of 47 (543g) items of metal were recovered, comprising five copper alloy, two lead alloy and 40 iron. The copper alloy group comprises three Roman coins; two of 1st to 3rd century date (Ra. 8, an *As* or *Dupondius* from ditch **9511** [fill **9512**] and Ra. 20, a *Sestertius* from ditch **8505** [fill **8506**]) and one of 4th century date (a *nummus* from ditch **9702** [fill **9703**]). All coins are very worn and cannot be identified to issuer or date other than the broad ranges outlined. Ra.1, a circular belt mount with annular pellet decoration forming a flower, is of medieval date and was recovered from topsoil **6900**. The majority of iron items (25) comprise nails of 'standard' form with circular heads and square shanks. This form is introduced in the Roman period and continues largely unchanged until industrialisation in the post-medieval period and so tighter dating is not possible. Two hobnails from the soles of leather shoes, recovered from ditches **9511** (fill **9512**) and **9614** (fill **9615**), are of Roman date. With the exception of a reaping hook-type tool fragment, recovered from subsoil **12001**, the remainder of the iron group are too fragmentary or corroded to identify to form or date. The reaping-hook is of probable post-medieval or modern date, but Iron Age or Roman dating cannot be ruled out. Of the two lead alloy items, Ra. 6 is a waste fragment from topsoil **8300**. Ra. 2, recovered from topsoil **5300**, is an unusual mount or brooch of probable medieval or post-medieval date. It is oval in plan with two projecting lugs on the reverse and moulded decoration comprising two crosses on the front.
- 6.17 A fairly large group (119 fragments, 2963g) of fired clay was recovered from 30 deposits. The majority are amorphous, retaining no surfaces or shape to aid identification of date or form. Probable loomweight fragments were recovered from ditch **1805** (fill **1806**), pit **8722** (fill **8723**) and subsoil **9801**, of uncertain form. A small group of rectangular fragments, possibly used in kilns or ovens, were also recovered.
- 6.18 A stem fragment of clay tobacco pipe (2g) was recovered from furrow **1504** (fill **1505**), broadly dated from the late 15th to late 19th century.
- 6.19 Three indeterminate fragments slag and industrial waste were recovered from three deposits.
- 6.20 A total of 22 prehistoric worked flint items (weighing 228g) were recovered from 11 deposits. All are flakes and as such cannot be closely dated.

7. THE BIOLOGICAL EVIDENCE

Animal Bone

- 7.1 Animal bones amounting to 443 fragments (17.266kg) was recovered through a combination of hand excavation and bulk soil sampling from 74 pit and ditch features in the three main areas of archaeological activity revealed in Areas 5 - 11. Artefactual material dating from the Late Bronze Age/Early Iron Age to the Modern era was also recovered from these features. The material varied in condition but was on the whole well preserved. Historical and modern damage was frequent, rendering 54% of the assemblage unidentifiable beyond the level of cattle or sheep size mammal. However, it has been possible to identify cattle (*Bos taurus*), sheep/goat (*Ovis aries/Capra hircus*), pig (*Sus scrofa sp.*), horse (*Equus caballus*), dog (*Canis familiaris*), domestic fowl (*Gallus gallus*), goose (*Anser anser*) and deer (*Cervidae?*). Where modern breakage was observed and re-fitting was possible, those fragments were recorded as a single bone.

Late Bronze Age/Early Iron Age

- 7.2 Thirteen fragments (21g) were recovered from deposit **11703**, the fill of pit **11702**. A partial sheep/goat mandible (6g) was the only fragment identifiable to species.

Late Prehistoric/Iron Age

- 7.3 A total of 87 fragments (1399g) were recovered from ten deposits, comprising of 8 ditch and pit fills and two layers in areas 7, 9, 10 and 11. The remains of cattle and sheep/goat were present in more or less equal amounts with 12 (793g) and 16 (84g) fragments recovered respectively. Each were represented almost exclusively by meat-poor skeletal elements many of which, such as a cattle metacarpal from ditch fill **861**, bore rough chop marks suggestive of the waste from the primary butchery. Eleven fragments (820g) of horse, were recovered in Areas 9 and 11 from deposits **7808**, **8610**, **8611** and **8708** the fill of ditches **7807**, **8609** and **8707**. The bone recovered was mainly upper limb bone fragments and also a pelvis from deposit **8708**. However, of note among the horse assemblage were three fragments of distal metapodial that displayed clear saw marks. Horse meat was eaten during this period but only occasionally, playing a minor role in protein intake. For this reason and the fact that no other saw, cut or chop marks were present on any of the other horse bone, it is more than likely that rather than butchery, these marks are the result of either bone working or the removal of the feet to render down the fat rich hooves for

tallow (Hambleton, 2008). A single fragment (1g) of a chicken ulna was also recovered from deposit **5311**, the fill of pit **5310**.

Late Iron Age/Early Roman

- 7.4 Fourteen fragments (1399g) were recovered from deposits **7704** and **8714**, the fills of pit **7703** and ditch **8713**. Of these 10 (1334g) were identified as cattle comprising of skull, vertebrae and lower limb bone fragments. No cut or chop marks to suggest butchery waste were present. Two further fragments were identifiable, a dog ulna and a deer metacarpal. This later bone was too fragmentary to confirm the species, but from the size, it is likely to be roe deer (*Capreolus capreolus*).

Roman

- 7.5 A total of 167 fragments (**5334**) were recovered from 23 deposits, the majority of which were the fills of pit and ditch features revealed in Areas 5, 6, 9, 10 and 11. Remains of the three major domestic species cattle, sheep/goat and pig were recovered. Cattle and sheep/goat were most common with 38 (3140g) and 22 (161g) fragments, while pig numbered only two (29g) fragments, reflecting a pattern of dietary contribution that is typical to this period (Cool, 2009). Cattle and sheep/goat were identified from elements from throughout the skeleton, both rich and poor in meat and although the numbers recovered are too low to indicate a definite pattern, many display chop marks relating to the waste from the stepped stages of butchery, from carcass dressing to kitchen waste. This is supported by the portion of the assemblage where identification was limited to cattle or sheep size mammal. The majority are meat-rich vertebrae or rib fragments which also display frequent cut or chop marks. Data relating to age at death was rare and could not provide any information relating to site economy or slaughter age. However from those mandible and long bone fragments present, it was clear that the cattle and sheep/goat remains originated from fully adult, but not aged livestock. Pig was identified from a partial mandible and humerus, neither of which displayed any butchery related damage. The remains of horse and dog were also present, as would be expected in this period (Baker and Worley, 2014) but with only three (774g) and one (11g) fragments the recovery is too low to infer any information beyond species identification.

Medieval

- 7.6 Thirty-seven fragments (552g) were recovered from deposit 1604, the fill of furrow 1603. Cattle, sheep/goat and pig were identified, all from meat-poor skeletal

elements. No marks relating to butchery practice were present and no information beyond species identification could be identified.

Post-medieval

- 7.7 Twelve fragments (1043g) were recovered from deposits **7706** and **9922**, the fills of ditches **7705** and **9921**. Cattle, pig and horse were identified from mainly meat-poor skeletal elements. No marks relating to butchery practice were present and as with the preceding phase, no information beyond species identification could be identified.

Modern, undated and unstratified

- 7.8 The remaining 104 fragments (6870g) were recovered from those deposits spread across Areas 6, 7, 10 and 11, which date to the modern era (ditch fill **8506**), are unstratified or remain undated. There are similarities with both the Late Prehistoric/Iron Age and Roman assemblages as cattle, sheep/goat and pig are identified from meat-rich and meat-poor fragments that display cut or chop marks relating to butchery practice. Horse and dog were also present as was a single fragment of domestic goose. This later species was identified from a partial humerus (15g) which, as it was recovered from topsoil layer **5300**, is likely to be residual in nature.

8. DISCUSSION

- 8.1 The survey area is dominated by a north-west/south-east running floodplain with gently sloping higher grounds to the west and east. Colluvial soils were recorded within a number of the lower-lying trenches.
- 8.2 Archaeological features were identified within all eighteen areas of the study area, with three **main** centres of activity being identified within Areas 5/6, Area 7 and Areas 10/11. Area 5/6 contains a small Romano-British settlement composed of rectilinear ditched enclosures with associated field systems located upon a south-east facing slope and continuing onto the top of the slope into Area 5, which is largely covered by extant medieval ridge and furrow cultivation. The geophysical survey and the evaluation confirm the survival of the earlier features beneath the furrows.

- 8.3 The geophysical survey of Area 7, which is centred on a low-lying ridge within the floodplain, identified an enclosure with a number of discrete features, the presence of which was confirmed by the evaluation. Two west–east orientated inhumation burials were also identified within **Trench 46** and are suggestive of a Christian burial rite, suggesting a Romano-British date. It is likely the burials relate to an enclosed farmstead/community occupying the ridge. The finds recovered are indicative of a domestic settlement.
- 8.4 Areas 10 & 11 are dominated by a third settlement which comprises a number of Iron Age ditches underlying Romano-British trackways, enclosure ditches, buried occupation soils and discrete features which include a possible robbed out wall with associated tesserae which demonstrates the presence of at least one significant Roman building in the immediate vicinity.
- 8.5 A small cluster of Romano-British ditches were identified in the north-east corner of Area 18. These features are likely to be a continuation of the Late Iron Age settlement identified by recent archaeological works off Lower Road, Stoke Mandeville.

9. CA PROJECT TEAM

Fieldwork was undertaken by Joe Whelan, assisted by Abigail Breen, Chris Brown, Steve Bush, Eduardo Cabrera, Francesco Catanzaro, Jon Dobbie, Ethan Ellis, Robert Falvey, Harriet Farr, James Hickson, Adam Howard, Pawel Jablonski, Georgina Johnston, Alice Jones, Steffan Klemenic, Agata Kowalska, Tomasso Rossi, Tim Street, Emily Stynes and Keighley Wasenczuk. The report was written by Emily Troake and Joe Whelan. The finds and biological evidence reports were written by Emma Aitken and Sarah Wyles. The illustrations were prepared by Esther Escudero. The archive has been compiled by Joe Whelan, and prepared for deposition by Zoe Emery. The project was managed for CA by Richard Greatorex.

APPENDIX B: THE PALAEOENVIRONMENTAL EVIDENCE

A series of 10 environmental samples (112 litres of soil) were processed from a range of features within one trench in Area 5, one trench in Area 7, two trenches in Area 9, two trenches in Area 10 and two trenches in Area 11 to evaluate the preservation and range of palaeoenvironmental remains across the area and with the intention of recovering environmental evidence of industrial or domestic activity on the site. These samples were processed by standard flotation procedures (CA Technical Manual No. 2).

Preliminary identifications of plant macrofossils are noted in Table 1 in Appendix C, following nomenclature of Stace (1997) for wild plants, and traditional nomenclature, as provided by Zohary *et al* (2012) for cereals. The presence of mollusc shells has also been recorded and nomenclature is according to Anderson (2005) and habitat preferences according to Kerney (1999) and Davies (2008).

The flots varied from relatively small to moderate in size with low to high quantities of rooty material and modern seeds. The charred material comprised varying levels of preservation. There was no evidence of vitrification within the charcoal assemblages.

Area 5 Trench 16

Fill 1604 (sample 2) of medieval ditch 1603 contained a small number of barley (*Hordeum vulgare*) and free-threshing wheat (*Triticum turgidum/aestivum* type) grain fragments and moderately small quantity of charcoal fragments greater than 2mm, including round wood pieces. The assemblage may be reflective of dispersed settlement waste.

A few mollusc shells were also noted, including those of the open country species *Vallonia costata* and *Vallonia excentrica* and the intermediate species *Trochulus hispidus*.

Area 7 Trench 57

A small charred assemblage, including wheat (*Triticum* sp.) grain fragments, hazelnut (*Corylus avellana*) shell fragments and a few charcoal fragments, were

noted from fill 5710 (sample 1) of late prehistoric pit 5709. This may be reflective of dispersed domestic hearth material.

The few mollusc shells recovered from this deposit included those of the open country species *Pupilla muscorum* and *Vallonia excentrica*, the intermediate species *Trochulus hispidus* and *Cochlicopa* sp. and the aquatic species *Anisus leucostoma*. *Anisus leucostoma* is a species which favours areas of seasonal flooding and desiccation.

Area 9 Trench 77

Fill 7706 (sample 5) of Romano-British ditch 7705 contained a low level of charred remains, including hulled wheat, emmer or spelt (*Triticum dicoccum/spelta*), grain fragments, seeds of persicaria (*Persicaria* sp.) and charcoal fragments. This assemblage may be representative of dispersed settlement waste material.

The small number of mollusc shells recorded included those of the open country species *Vallonia costata*, *Vallonia excentrica*, *Vertigo* sp. and *Pupilla muscorum*, the intermediate species *Cochlicopa* sp. and *Trochulus hispidus* and the shade-loving species *Oxychilus cellarius* and *Vitrea* sp.

Trench 78

Small charred assemblages, including barley and hulled wheat grain fragments, seeds of vetch/wild pea (*Vicia/Lathyrus* sp.), bedstraw (*Galium* sp.) and goosefoot (*Chenopodium* sp.), and charcoal fragments, were recovered from fill 7808 (sample 3) of Iron Age ditch 7807 and fill 7812 (sample 4) of Romano-British ditch 7811. These may be reflective of dispersed domestic material.

The moderate number of mollusc shells noted from these ditches included those of the open country species *Vallonia excentrica*, *Vallonia costata* and *Vertigo* sp., the intermediate species *Trochulus hispidus* and *Cochlicopa* sp. and the shade-loving species *Merdigera obscura*, *Discus rotundatus*, *Oxychilus cellarius*, *Vitrea* sp. and *Clausilia bidentata*. These assemblages may be indicative of a well-established open landscape with possible areas of woodland edge/scrub/hedgerow and longer grass in the vicinity.

Area 10 Trench 94

A moderate charred plant assemblage was recorded from fill 9404 (sample 13) within Romano-British ditch 9403. The cereal remains included hulled wheat, emmer or spelt grain, spikelet fork and glume base fragments, barley grains and a possible free-threshing wheat grain fragment. A number of the chaff elements were identifiable as those of spelt wheat (*Triticum spelta*) and some as those of emmer wheat (*Triticum dicoccum*). Spelt wheat is the predominant wheat in Southern Britain within the later prehistoric and Roman periods (Greig 1991). The weed seeds included seeds of brome grass (*Bromus* sp.), vetch/wild pea, rye-grass/fescue (*Lolium/Festuca* sp.), clover/medick (*Trifolium/Medicago* sp.), meadow grass/cat's tails (*Poa/Phleum* sp.) and docks (*Rumex* sp.). There was a small quantity of charcoal fragments noted. This assemblage is likely to represent the dumped material from crop processing waste. The weed seeds are generally species typical of grassland, field margins and arable environments.

The small mollusc assemblage included shells of the open country species *Vallonia excentrica* and *Vallonia costata* and the intermediate species *Trochulus hispidus*.

Trench 95

Fill 9512 (sample 11) of Romano-British ditch 9511 and fill 9507 (sample 12) of Romano-British pit 9506 contained a small charred plant assemblage, including a few hulled wheat grain and glume base fragments and seeds of vetch/wild pea, and low to moderate quantities of charcoal fragments. The charcoal included both round and mature wood pieces. A number of the glume base fragments were identifiable as being those of spelt wheat. These assemblages may be representative of scatted settlement waste.

The moderate number of mollusc shells included those of the open country species *Vallonia excentrica*, *Vallonia costata* and *Vertigo pygmaea*, the intermediate species *Cochlicopa* sp. and *Trochulus hispidus*, and the shade-loving species *Carychium* sp. and *Merdigera obscura*. Again these assemblages may be indicative of a well-established open landscape with possible areas of woodland edge/scrub/hedgerow and longer grass in the vicinity.

Area 11 Trench 92

A large charred plant assemblage was recorded from fill 9215 (sample 10) within Romano-British ditch 9205. The cereal remains included barley grain and hulled

wheat, emmer or spelt grain, spikelet fork and glume base fragments. A number of the chaff elements were identifiable as those of spelt wheat. The weed seeds included seeds of brome grass, vetch/wild pea, rye-grass/fescue, clover/medick, meadow grass/cat's tails, hedge-parsley (*Torilis* sp.), field madder (*Sherardia arvensis*), sedge (*Carex* sp.) and docks. There were also a few fragments of hazelnut shell noted. There was a moderately large quantity of charcoal fragments recovered. This assemblage is likely to be representative of dumped crop processing and settlement waste material and the weed seeds are generally species typical of grassland, field margins and arable environments.

The high number of mollusc shells included shells of the open country species *Vallonia excentrica*, *Vallonia costata*, *Vertigo* sp. and *Pupilla muscorum*, the intermediate species *Trochulus hispidus*, *Cochlicopa* sp. and *Punctum pygmaeum*, the shade-loving species *Carychium* sp. and *Vitrea* sp. and the aquatic species *Anisus leucostoma*, *Galba truncatula*, *Bithynia* sp. and *Planorbis planorbis*. The mollusc assemblage appears to be indicative of a well-established open landscape with areas of long damp grass in the vicinity of the ditch. It also seems likely that the ditch acted as a drainage ditch at times.

Trench 99

A small charred assemblage, including hulled wheat grain fragments and spelt wheat glume base fragments and a few charcoal fragments, was noted from fill 9920 (sample 9) Romano-British ditch 9919. This may be representative of dispersed domestic settlement material.

The moderate mollusc assemblage included shells of the open country species *Vallonia excentrica*, *Vallonia costata*, *Helicella itala*, *Vertigo* sp. and *Pupilla muscorum*, the intermediate species *Trochulus hispidus* and *Cochlicopa* sp., the shade-loving species *Aegopinella nitidula* and the aquatic species *Anisus leucostoma*. The assemblage may be indicative of a well-established open landscape with a local area of damp grassland subject to seasonal flooding and desiccation in the vicinity of the ditch.

Trench 117

The upper fill (11703, sample 14) within undated pit 11702 contained large quantities of unidentified charcoal fragments greater than 2mm. Within the sample there was *Stellaria* sp. (stitchwort) and *Poa/Phluem* (meadow grass) and also a

single indeterminate grain. The assemblage is likely to be representative of dumped material.

The snails within the sample indicate a dry landscape with very little changes in environmental factors. The environmental remains provide no indication of the date of this deposit and no firm evidence for any specific activity taking place on site such as metalworking or charcoal production.

Summary

The charred plant remains provide an indication of settlement activities taking place on the site during the later prehistoric, Romano-British and medieval periods, particularly in Areas 10 and 11 during the Romano-British period. The environmental evidence from Areas 5, 7 and 9 appears to be that more typical of settlement edge rather than of domestic activities taking place in the immediate vicinity. There is an indication of the exploitation of a variety of different environments from both the range of weed seed species and the presence of hazelnut shells.

The molluscan assemblages appear to be indicative of a well-established open landscape, with some areas of woodland edge/scrub/hedgerow and longer damp grass and a suggestion of occasional flooding and seasonal desiccation and the possible use of drainage ditches in some parts of the site.

Recommendations for sampling if further work takes place on the site

The evaluation has demonstrated that environmental material is preserved on the site. If further work takes on the site, a suitable sampling strategy should be put in place. It is proposed that secure phased deposits, especially any arising and related to settlement activities and /or structures will be considered for sampling, with a general sample size of 20-30 litres, for the recovery of charred plant remains, charcoal and mineralised remains with the aim of covering as wider range of feature types, spatial spread and phases as possible on the site. Any cremation related deposits should be sampled appropriately for the recovery of cremated human bone and charred remains. If any evidence of in situ metal working is found, suitable samples for the recovery of slag and hammer scale should be taken.

It is also suggested that the taking of sequences of samples for the recovery of molluscs and/or waterlogged remains should be considered through any suitable

deposits such as deep enclosure ditches, barrow ditches, palaeo-channels, or buried soils. Monolith samples should also be taken from this kind of deposit as appropriate.

APPENDIX D: OASIS REPORT FORM

PROJECT DETAILS	
Project Name	South West Aylesbury, Buckinghamshire: Evaluation
Short description	<p>An archaeological evaluation was undertaken by Cotswold Archaeology in two phases between March and May 2018 on land south of Aylesbury. One hundred and four trenches were excavated during the first phase and a further thirty eight trenches in phase two. Localised flooding during the first phase of works limited the numbers of archaeological features that could be hand excavated but despite the adverse weather conditions three main centres of archaeological activity were identified in addition to a number of outlying features, chiefly boundary /enclosure ditches.</p> <p>Areas 5 / 6; a large number of rectilinear enclosure ditches, which appear to match the geophysical survey, demonstrate the likely presence of a Romano-British settlement. Extant Medieval ridge and furrow cultivation overlies part of the settlement area with the earlier ditches visibly surviving beneath the field system.</p> <p>Area 7; the archaeological activity is focused on a low hill within the centre of a flood plain. A number of late prehistoric / Romano-British ditches enclose two west-east orientated inhumation burials and a number of discrete features within the brickearth, indicating the presence of an enclosed farmstead or possible small settlement site.</p> <p>Areas 10 / 11 are dominated by a large concentration of late prehistoric and Romano-British ditches and occupation soils in addition to material evidence demonstrating the presence of a significant Roman building lies within the immediate area. A third inhumation burial was also recorded demonstrating the presence of a third settlement site within the survey area.</p>
Project dates	5 March to 18 May 2018
Project type	Evaluation
Previous work	Geophysical survey SUMO 2017
Future work	Unknown
PROJECT LOCATION	
Site Location	Calley Farm South Aylesbury Extension, Buckinghamshire
Study area (M ² /ha)	107ha
Site co-ordinates	481072 / 211596
PROJECT CREATORS	
Name of organisation	Cotswold Archaeology
Project Brief originator	

Project Design (WSI) originator	Cotswold Archaeology	
Project Manager	Richard Greatorex	
Project Supervisor	Joe Whelan	
MONUMENT TYPE	Iron Age / Romano-British settlement sites / farmsteads, Medieval Ridge & furrow	
SIGNIFICANT FINDS	Ceramics, metal work, inhumations	
PROJECT ARCHIVES	Intended final location of archive (museum/Accession no.)	Content (e.g. pottery, animal bone etc)
Physical	Buckinghamshire County Museum	Stone, ceramics, animal bone metalwork
Paper	Buckinghamshire County Museum	Context sheets, registers
Digital	Buckinghamshire County Museum	Database, digital photos
