Summary

An archaeological trench evaluation on land at Secmaton Rise, Dawlish, Devon (SX 9655 7787), was undertaken by AC archaeology during October and November 2011. The site comprises a rectangular parcel of land that covers c. 4.6 hectares on the northern edge of Dawlish. It is situated in an area where only limited evidence for archaeological activity has previously been identified.

The evaluation comprised the machine-excavation of 21 trenches, totalling 662.5m in length and each 2m wide, with these positioned to provide representative coverage. Largely negative results were recorded, with the only cut feature identified comprising a modern drainage trench in the southeast corner. In the lower-lying central and southern part of the site a sterile colluvial layer was present, which contained no deposits of palaeoenvironmental interest. Only a small number of artefacts were recovered, with these mainly of modern date, although two prehistoric chert waste flakes were also found.

1. INTRODUCTION

- 1.1 An archaeological trench evaluation on land at Secmaton Rise, Dawlish, Devon, was undertaken by AC archaeology during October and November 2011. The work was commissioned by Strongvox Homes and was the first stage in a programme of archaeological works carried out as a condition (11) of outline planning consent for residential development and associated infrastructure works. The location of the site is shown on Fig. 1.
- 1.2 The site comprises a rectangular area of land that covers c. 4.6 hectares on the northern edge of Dawlish. The ground slopes gently down to the north between 30 and 40m OD, with the underlying geology of the area comprising Dawlish Sandstone.

2. ARCHAEOLOGICAL BACKGROUND

- 2.1 A desk based assessment and walkover have been previously undertaken for the site (Collings and Steinmetzer 2010). This established that the site is located in an area where only limited evidence for archaeological activity has previously been identified, although there is a general potential for prehistoric occupation, indicated for example, by an earlier discovery of a Bronze Age axe from c. 200m to the north.
- 2.2 A recent archaeological evaluation on land immediately to the northwest of the site (Hughes and Firth 2010) identified layers of colluvium within a natural combe that contained pottery dating to the Romano-British period. The only *in situ* remains present were two parallel and adjacent linear features, likely to represent the position of a former hedgebank boundary as depicted on 18th and 19th-century historic maps.

3. AIMS

- 3.1 The aim of the evaluation was to establish the presence or absence, extent, depth, character and date of any archaeological features, deposits or finds within the site. The results of the work, as set out in this report, will be reviewed and used to inform any subsequent mitigation as a second stage of archaeological works.

4. METHODOLOGY

- 4.1 The evaluation was undertaken in accordance with a project design prepared by AC archaeology (Valentin 2011), submitted to and approved by Devon County Historic Environment Service prior to commencement on site. It comprised the machine-excavation of 21 trenches totalling 662.5m and with each trench 2m wide. Trenches were positioned throughout the proposed development area. Stripping ceased at the level at which natural subsoil was exposed. A number of trenches shown on Fig. 1 of the original project design were not excavated due to on-site constraints. These comprised Trenches 2, 4, 6-8, 25 and 28. The positions of trenches as excavated are shown on Fig. 2, with the numbering system retained from the original project design and site archive.
- 4.2 All deposits revealed were recorded using the standard AC archaeology pro-forma recording system, comprising written, graphic and photographic records, and in accordance with AC archaeology's *General Site Recording Manual, Version 1*. Detailed sections were produced at a scale of 1:20. All site levels relate to Ordinance Datum.

5. RESULTS

- 5.1 The trenches were excavated to a depth of between 0.25-1.22m below ground level onto bedded sand/sandstone and breccia natural subsoil. The overlying layer sequence comprised between 0.10-0.50m of dark reddish brown silty sand topsoil over between 0.10-0.57m of mid brown to light orange silty sand agricultural subsoil. An up to 0.60m thick deposit of colluvium was recorded in a number of the trenches in the lower-lying parts of the site, in particular those in the central and southern fields. Tabulated context descriptions for all excavated trenches are included as Appendix 1, representative sections are shown on Fig. 3 and photographs included as Plates 1-6.
- 5.2 No pre-modern *in situ* archaeological deposits or features were observed during the evaluation. A single northwest to southeast aligned linear feature identified crossing Trenches 24 and 27 was established to be a modern drainage trench. A small quantity of finds was recovered from topsoil contexts (see below).

6. THE FINDS

6.1 Introduction

All finds recovered on site have been cleaned and marked where appropriate, then quantified within each context. The assemblage has been scanned by context to extract information regarding the range, nature and date of artefacts represented, with this information briefly discussed below. Finds totals by material type are given in Table 1.

Table 1. Finds quantifications (weight is in grams)

| Trench No | Context | Context type | Worked chert | | Post-medieval/modern pottery | | Clay pipe | | Glass | | Bakelite | |
|---------------|---------|--------------|--------------|----------|------------------------------|------------|-----------|-----------|----------|-----------|----------|-----------|
| | | | No | Wt | No | Wt | No | Wt | No | Wt | No | Wt |
| 9 | 900 | Topsoil | | | 17 | 163 | 5 | 12 | 1 | 5 | | |
| 11 | 1100 | Topsoil | | | 6 | 44 | 2 | 5 | 3 | 33 | | |
| 12 | 1200 | Topsoil | | | 4 | 14 | 1 | 2 | 1 | 3 | 1 | 14 |
| 14 | 1400 | Topsoil | | | 4 | 16 | | | | | | |
| 16 | 1500 | Topsoil | 2 | 8 | 12 | 55 | 1 | 5 | 2 | 8 | | |
| Totals | | | 2 | 8 | 43 | 292 | 9 | 24 | 7 | 49 | 1 | 14 |

6.2 Worked chert

Two pieces of prehistoric worked chert were recovered from the topsoil of Trench 15. These are both waste flakes and are not diagnostic to period, although a later prehistoric date is likely.

6.3 Post-medieval/modern pottery

A total of 43 sherds of post-medieval to modern pottery was recovered, all from topsoil contexts. The majority of the assemblage comprises 19th to 20th-century industrial whiteware and blue transfer-printed wares. There is also one stoneware sherd and one lead-glazed red earthenware sherd, with the latter probably dating to the 18th or 19th century.

6.4 Clay tobacco pipe

All the clay tobacco pipe fragments are undiagnostic stems of 18th or 19th century date.

6.5 Glass

All the glass is modern bottle glass from topsoil contexts. Clear, blue and green glass is all represented.

6.6 Bakelite

The single piece of bakelite recovered is from a small dish or bowl with a pedestal base.

7. DISCUSSION

7.1 The evaluation has established largely negative results, with the only archaeological cut feature identified comprising a modern drainage trench in the southeast part of the site. In the central and southern lower-lying part of the site colluvial deposits were present, which were largely sterile sands, with no buried soils, organic material or other deposits of palaeoenvironmental interest present. Very few artefacts were recovered, with these wholly from topsoil contexts. These include two prehistoric chert waste flakes, with these likely to represent a small background scatter, rather than evidence for *in situ* settlement nearby.

8. CONCLUSION

8.1 Based on the results of this work it is considered unlikely that groundworks associated with the development will have an impact on any significant archaeological remains relating to early settlement, funerary or agricultural practices. The only feature identified was a modern drainage trench and very few pre-modern artefacts were recovered.

9. ARCHIVE AND OASIS

9.1 The paper and digital archive and retained finds are currently stored at the offices of AC archaeology Ltd, at 4 Halthaies Workshops, near Exeter, Devon, EX5 4LQ. These will ultimately be deposited under the relevant accession number at RAMM, Exeter, at the earliest in 2013 when the current museum non-acceptance policy will be reviewed.

9.2 The OASIS (Online AccesS to the Index of Archaeological InvestigationS) number for this project is 115179.

10. ACKNOWLEDGEMENTS

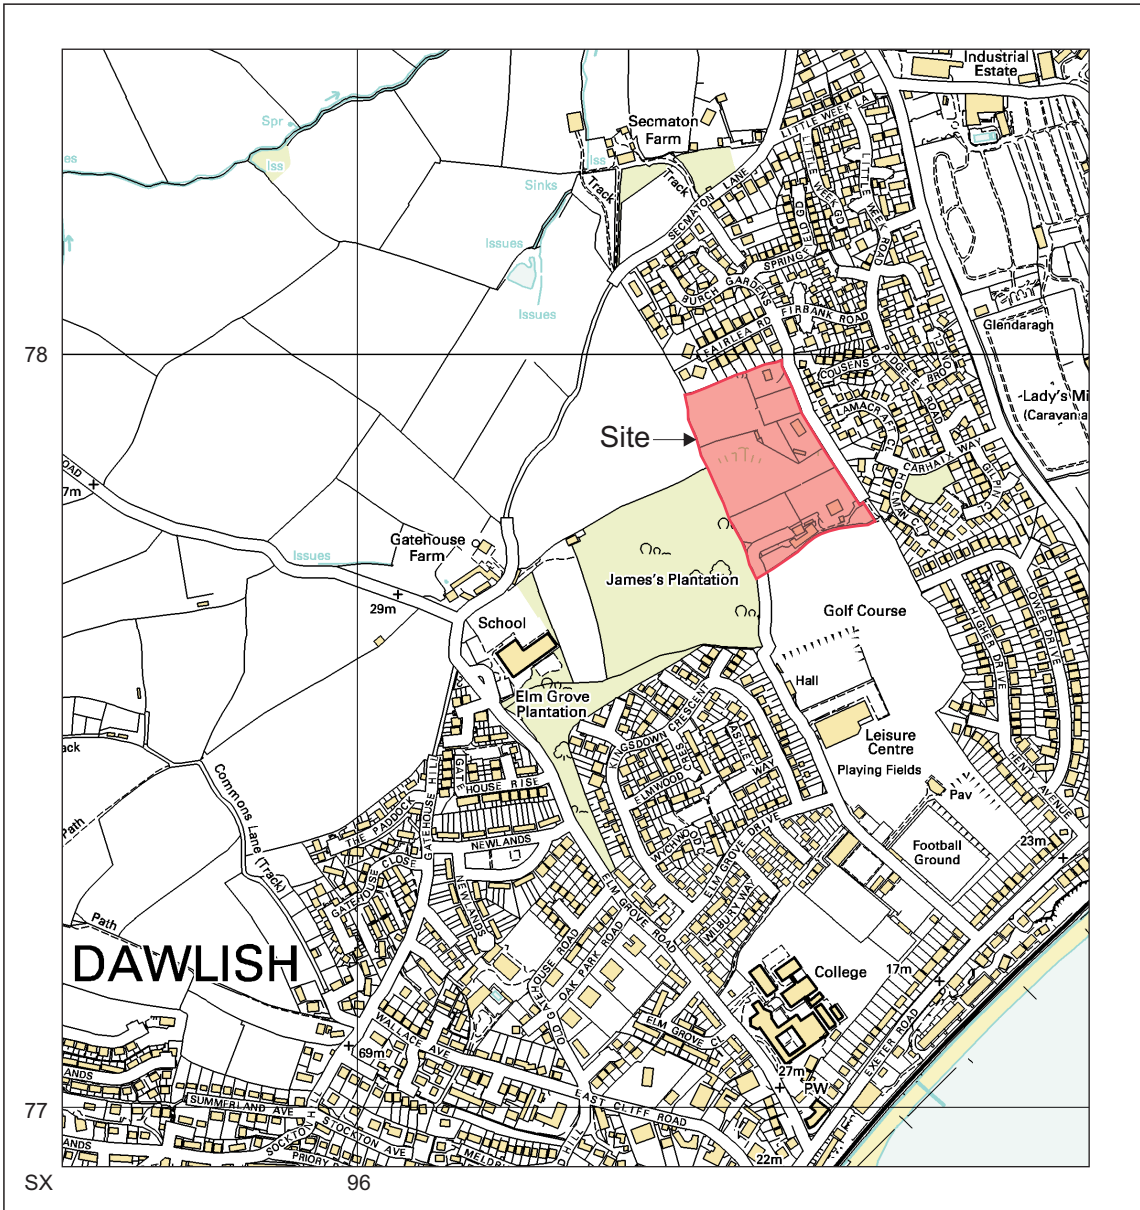

10.1 The evaluation was commissioned by Scott Gill and Paul Hollyman of Strongvox Homes. The site trial trenching was carried out by Paul Jones, Kerry Dean, Frances Ward and Chris Caine, with the illustrations for this report prepared by Cain Hegarty. The advice and collaboration of Stephen Reed, Devon Archaeology Officer, is duly acknowledged.
