SUMMARY

John Moore Heritage Services carried out an archaeological watching brief at West Streatley House, High Street, Streatley-On-Thames on the 16th November 2020 (NGR SU 59348 80761). The purpose of the watching brief was for the removal of the existing conservatory and replacement with a single side/rear extension incorporating five hidden roof lights; terraced garden; the installation of three roof lights at second floor level; and the insertion of one new window to the existing side dormer. During the watching brief, a series of foundation footings were excavated. This particular area had potential for Palaeolithic, Bronze Age, Iron Age, Roman, early medieval, medieval, post-medieval and modern remains. However, over the course of the watching brief, no significant archaeological features or artefacts were uncovered.

1 INTRODUCTION

1.1 Site Location (Figure 1)

The development site is located at West Streatley House, High Street, Streatley-On-Thames (NGR SU 59348 80761). The site lies at approximately 56m AOD. The underlying geology is ZigZag Chalk Formation.

1.2 Planning Background

West Berkshire District Council granted planning permission for the removal of the existing conservatory and replacement with a single side/rear extension incorporating five hidden roof lights; terraced garden; the installation of three roof lights at second floor level; and the insertion of one new window to the existing side dormer. (West Berkshire planning reference: 19/01227).

Due to the archaeological and historical importance of the surrounding area a condition was attached to the permission requiring a watching brief to be maintained during the course of building operations or construction works on the site.

No above ground development shall take place within the application area until the applicant has secured the implementation of a programme of archaeological work in accordance with a written scheme of investigation which has been submitted to and approved in writing by the Local Planning Authority. Thereafter the development all incorporate and be undertaken in accordance with the approved statement.

Reason: To ensure that any significant archaeological remains that are found are adequately recorded.

1.3 Archaeological Background

The Site is formed by the Grade II listed building of West Streatley House but there are no non-designated heritage assets within the Site. However, the scheduled remains of a dovecote are located within the study area.

There are nine assets of prehistoric date recorded within the study area, including evidence of Palaeolithic, Bronze Age and Iron Age activity.

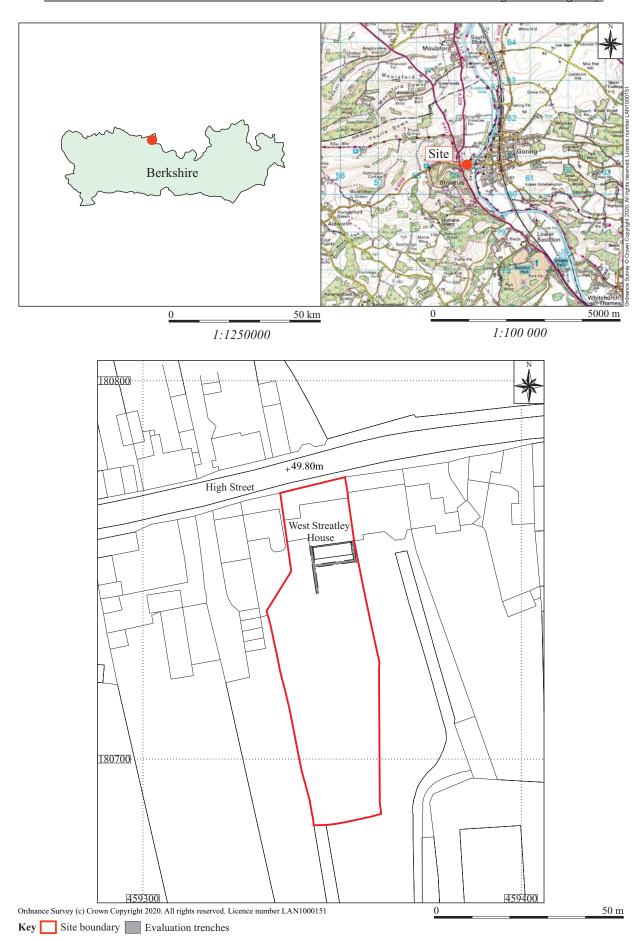

Figure 1: Site location

The desk-based assessment (Archaeology Collective 2018) concluded there was a low potential for archaeological deposits of prehistoric date.

Evidence of Roman activity within the study area comprise the location of a supposed farm, linear anomalies identified in a geophysical survey, and the find spots of material and artefacts. The desk-based assessment concluded there was a medium potential for archaeological deposits of Roman date.

The centre of the settlement of Streatley is located c.208m to the west of the Site and is thought to have early medieval origins. A Saxon burial and the find spot of a spearhead are also located within the study area. The desk-based assessment concluded there was a low potential for archaeological deposits of early medieval date.

Evidence of medieval activity within the study area includes the location of a manor house, the site of Goring Priory, evidence of the medieval use of St. Thomas of Canterbury church, linear parallel earthworks and the find spots of material and artefacts. The desk-based assessment concluded there was a medium potential for archaeological deposits of medieval date.

Assets of post-medieval and modern date relate to the continuing development and growth of the settlement at Streatley. There is evidence of agricultural and industrial activity within the study area, as well as evidence relating to settlement activity, including houses and transportation networks. The desk-based assessment concluded there was a medium potential for archaeological deposits of post-medieval and modern date.

Cartographic evidence suggests that the Site has remained as a house and its associated land and gardens, although West Streatley House has been subdivided from Streatley House during the modern period.

2 AIMS OF THE INVESTIGATION

The aims of the investigation as laid out in the Written Scheme of Investigation (Archaeology Collective 2019) were as follows:

- To determine the presence or absence or archaeological deposits or remains
- To record the character, date location and preservation of any archaeological remains on site.
- To record the nature and extent of any previous damage to archaeological deposits or remains on site.

In particular:

• To record any evidence relating to the Romano British, Saxon, early medieval and medieval periods.

3 STRATEGY

3.1 Research Design

John Moore Heritage Services carried out the work to a Written Scheme of Investigation (Archaeology Collective 2019) that had been agreed with West Berkshire Council. The recording was carried out in accordance with the standards specified by the Chartered Institute for Archaeologists (2014).

3.2 Methodology

The groundworks consisted of the excavation of a series of foundation trenches, which covered an area roughly 12m squared. The foundation trenches were 0.70m wide and reached a maximum depth of 1.68m.

Where archaeological horizons were encountered they were cleaned by hand and excavated appropriately. Standard John Moore Heritage Services techniques were employed throughout, involving the completion of a written record for each deposit encountered, with scale plans and section drawings compiled where appropriate. A photographic record was also produced. The resultant spoil from the works was visually scanned, especially for finds relating to Iron Age, Roman, early medieval and medieval periods.

4 RESULTS

All deposits and features were assigned individual context numbers. Context numbers without brackets indicate features i.e. pit cuts, numbers in () show feature fills or deposits of material, while numbers in bold indicate structural features. A series of foundation trenches covering an area roughly 12m squared, were excavated down to a maximum depth of 1.68m and measured 0.70m wide.

The earliest recorded deposit comprised a compact, mid yellowy-grey sandy gravel (102) (Figure 2; Plan 100, Sections 100 and 101; Plates 1 and 2). It contained frequent inclusions of small to large pieces of flint and chalk. Deposit (102) measured greater than 12m in length and in width, as well as greater than 0.74m in thickness at a maximum depth of 1.02m. This deposit was identified as the natural chalk geology and was observed throughout the full extent of the excavated foundation footings.

Overlying the natural deposit (102) was a friable, mid brown sandy-silt (104) (Figure 2; Plan 100 and Section 101; Plate 2). It contained inclusions of infrequent flecks to small pieces of chalk. It measured greater than 0.70m in width and greater than 4m in length, with a thickness of 0.45m at a depth of 0.55m. This deposit was only observed in the south-western extent of the site, and was not identified towards the existing house. Deposit (104) has been identified as a subsoil associated with the pre-existing garden plots within this area.

Stratified above deposit (104) was a friable, dark grey silty-clay (101) (Figure 2; Plan 1 and Sections 100 and 101; Plates 1 and 2). This deposit contained infrequent inclusions of flecks to small pieces of chalk and stones as well as infrequent rooting. It measured greater than 12m in length and in width as well as measuring between 0.4 and 0.28m in thickness. This deposit was observed at a depth of between 0.20m and

0.31m. Deposit (101) has been identified as a pre-existing garden soil deposit, due to the dark colour, silty composition and the root inclusions.

Plate 1: Section 100. Looking North.

Plate 2: Section 101. Looking East.

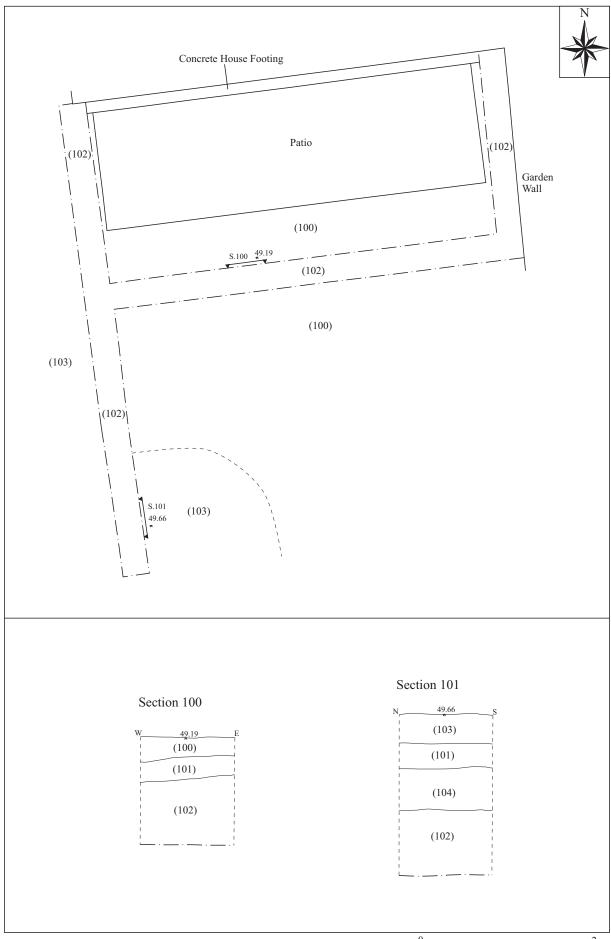

Figure 2: Foundation Trench Plan and Sections.

Overlying deposit (101) was a loose, mid brown silty-sand (100) (Figure 2; Plan 100 and Section 100; Plate 1). It contained inclusions of flecks to medium-sized pieces of stone rubble, brick rubble and chalk. Deposit (100) measured greater than 12m in length and in width, as well as measuring 0.28m in thickness. This deposit was observed as underling the existing patio surface, as well as being truncated by the construction of the existing house foundations. Deposit (100) has therefore been identified as a made-ground levelling deposit for the construction of the house.

The latest deposit observed, and subsequently overlying the made-ground deposit (100) was a loose, light grey-white mixed material of chalky sand and tarmac (103) (Figure 2; Plan 100 and Section 101; Plate 2). It contained further inclusions of small pieces of brick and stone rubble. Deposit (103) measured greater than 2.50m in width and greater than 3m in length and had a maximum thickness of 0.30m. This deposit was identified as a modern surface, it was identified as overlying the made ground deposit (100) in the south and south-eastern area of the site.

4.2 Reliability of Results

The reliability of the results is considered to be good. The groundworks were completed in on day, and the weather was slightly overcast, so visibility was good.

5 FINDS

No archaeological material or artefacts from any period were discovered during the course of the watching brief.

6 DISCUSSION

The watching brief aimed to identify the presence or absence of significant archaeological remains, with a particular focus on the Romano-British, Saxon, early medieval and medieval periods. During the course of the watching brief, no archaeological features or remains relating to these periods, or any other period other than the modern period were uncovered.

7 ARCHIVE

A Digital Archive is maintained by John Moore Heritage Services (ID 4167) and will be made available upon request (to admin@jmheritageservices.co.uk). Digitised copies of all the primary records will be made publicly available as appendix to the Final Report submitted to OASIS (ID johnmoor1_408882).
